Metabolism: Hepatic; chemical hydrolysis to monohydroxymelphalan and dihydroxymelphalan

Bioavailability: Unpredictable; 61% ± 26%, decreasing with repeated doses

Half-life elimination: Terminal: I.V.: 1.5 hours; oral: 1-1.25 hours

Time to peak, serum: ~1-2 hours

Excretion: Oral: Feces (20% to 50%); urine (10% to 30% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; avoid concurrent use with clozapine and carbamazepine

Oncology: Bone Marrow CommentsSaline-based hydration (100-125 mg/m^2/hour) preceding (2-4 hours), during, and following (6-12 hours) administration reduces risk of drug precipitation in renal tubules. Hydrolysis causes loss of 1% melphalan injection per 10 minutes. Infusion of admixture must be completed within 100 minutes of preparation to deliver ordered dose. Reconstitute dose to 5 mg/mL in diluent provided by manufacturer. Dose may be infused via central or peripheral venous access without further dilution to minimize volume of infusion.

Index TermsL-PAM; L-Sarcolysin; NSC-8806; Phenylalanine Mustard

English

Jump To Field (Select Field Name)

Pronunciation(me MAN teen)

U.S. Brand NamesNamenda™

Canadian Brand NamesEbixa®

Pharmacologic CategoryN-Methyl-D-Aspartate Receptor Antagonist

Use: Labeled IndicationsTreatment of moderate-to-severe dementia of the Alzheimer's type

Use: Unlabeled/InvestigationalTreatment of mild-to-moderate vascular dementia; mild cognitive impairment

Dosing: Adults

Alzheimer's disease: Oral: Initial: 5 mg/day; increase dose by 5 mg/day to a target dose of 20 mg/day; wait at least 1 week between dosage changes. Doses >5 mg/day should be given in 2 divided doses.

Suggested titration: 5 mg/day for ≥1 week; 5 mg twice daily for ≥1 week; 15 mg/day given in 5 mg and 10 mg separated doses for ≥1 week; then 10 mg twice daily.

Mild-to-moderate vascular dementia (unlabeled use): Oral: 10 mg twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild-to-moderate impairment: No adjustment required.

Severe impairment: Cl_{cr} 5-29 mL/minute): 5 mg twice daily

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to memantine or any component of the formulation

Allergy Considerations

- Adamantane Derivative Allergy

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment; dose adjustment recommended.
- Seizure disorder: Use with caution in patients with a history of seizure disorder; may increase risk of seizures.

Other warnings/precautions:

- Urine pH: Clearance is significantly reduced by alkaline urine; use caution with medications, dietary changes, or patient conditions which may alter urine pH.

Geriatric ConsiderationsIn clinical trials, patients on memantine had less of a decline in cognitive function and activities of daily living (ADL) as compared to placebo. This was true for monotherapy with memantine, as well as combination therapy with donepezil, an acetylcholinesterase inhibitor.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Hypertension (4%), cardiac failure, syncope, cerebrovascular accident, transient ischemic attack

Central nervous system: Dizziness (7%), confusion (6%), headache (6%), hallucinations (3%), pain (3%), somnolence (3%), fatigue (2%), aggressive reaction, ataxia, vertigo

Dermatologic: Rash

Gastrointestinal: Constipation (5%), vomiting (3%), weight loss

Genitourinary: Micturition

Hematologic: Anemia

Hepatic: Alkaline phosphatase increased

Neuromuscular & skeletal: Back pain (3%), hypokinesia

Ocular: Cataract, conjunctivitis

Respiratory: Cough (4%), dyspnea (2%), pneumonia

<1%: Allergic reaction, alopecia, amnesia, angina, apathy, aphasia, apnea, appetite increased, asthma, atrial fibrillation, blepharitis, blurred vision, bradycardia, cardiac arrest, cellulitis, cerebral hemorrhage, conjunctival hemorrhage, convulsions, coordination abnormal, corneal opacity, crying abnormal, dehydration, delirium, delusion, depersonalization, dermatitis, diabetes mellitus aggravated, diplopia, diverticulitis, dysuria, eczema, emotional lability, erythematous rash, esophageal ulceration, extrapyramidal disorder, eye pain, gastroenteritis, gastrointestinal hemorrhage, glaucoma, hearing decreased, hematuria, hemiplegia, hemoptysis, hyperkinesias, hypertonia, hypoesthesia, hyponatremia, hypotension, hypothermia, involuntary muscle contractions, lacrimation abnormal, leukopenia, libido increased, macula lutea degeneration, melena, MI, myopia, nervousness, neuralgia, neuropathy, neurosis, paranoid reaction, paresthesia, paroniria, personality disorder, postural hypotension, pruritus, psychosis, ptosis, pulmonary edema, pulmonary embolism, retinal detachment, retinal hemorrhage, skin ulceration, sleep disorder, stupor, suicide attempt, thinking abnormal, thrombophlebitis, tinnitus, tremor, urinary retention, urticaria, visual acuity decreased, xerophthalmia

Postmarketing and/or case reports (limited to important or life-threatening): AV block, cerebral infarction, dyskinesia, dysphagia, hepatic failure, hyperlipidemia, hypoglycemia, ileus, NMS, pancreatitis, renal failure, QT prolongation, seizure, Stevens-Johnson syndrome, sudden death, tardive dyskinesia, thrombocytopenia

Drug Interactions

Carbonic Anhydrase Inhibitors: May decrease the excretion of Memantine. *Risk C: Monitor therapy*

Sodium Bicarbonate: May decrease the excretion of Memantine. *Risk C: Monitor therapy*

Trimethoprim: May enhance the adverse/toxic effect of Memantine. Specifically, the risk of myoclonus and/or delerium may be increased. Trimethoprim may increase the serum concentration of Memantine. Memantine may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess therapeutic effectiveness and adverse reactions on a regular basis throughout therapy (eg, hypertension, CNS changes, rash, constipation). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationTake as directed with or without food. May cause hypertension (monitor if recommended); headache (consult prescriber for analgesic). Report increase or changes in CNS symptoms (confusion, hallucinations, fatigue, aggressive reaction); chest pain or palpitations, dizziness or fainting; difficulty breathing of tightness in chest; rash; alteration in elimination patterns, or other persistent adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral: 2 mg/mL (360 mL) [alcohol free, dye free, sugar free; peppermint flavor]

Tablet, as hydrochloride: 5 mg, 10 mg

Combination package [titration pack contains two separate tablet formulations]: Memantine hydrochloride 5 mg (28s) and memantine hydrochloride 10 mg (21s)

Mechanism of ActionGlutamate, the primary excitatory amino acid in the CNS, may contribute to the pathogenesis of Alzheimer's disease (AD) by overstimulating various glutamate receptors leading to excitotoxicity and neuronal cell death. Memantine is an uncompetitive antagonist of the N-methyl-D-aspartate (NMDA) type of glutamate receptors, located ubiquitously throughout the brain. Under normal physiologic conditions, the (unstimulated) NMDA receptor ion channel is blocked by magnesium ions, which are displaced after agonist-induced depolarization. Pathologic or excessive receptor activation, as postulated to occur during AD, prevents magnesium from reentering and blocking the channel pore resulting in a chronically open state and excessive calcium influx. Memantine binds to the intra-pore magnesium site, but with longer dwell time, and thus functions as an effective receptor blocker only under conditions of excessive stimulation; memantine does not affect normal neurotransmission.

Pharmacodynamics/Kinetics

Distribution: 9-11 L/kg

Protein binding: 45%

Metabolism: Forms 3 metabolites (minimal activity)

Half-life elimination: Terminal: 60-80 hours; severe renal impairment (Cl_{cr} 5-29 mL/minute): 117-156 hours

Time to peak, serum: 3-7 hours

Excretion: Urine (57% to 82% unchanged); excretion reduced by alkaline urine pH

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Index TermsMemantine Hydrochloride

Canadian Brand NamesMenjugate®

Pharmacologic CategoryVaccine

Use: Labeled IndicationsTo provide active immunization against invasive meningococcal disease caused by *N. meningitidis* serogroup C, in children ≥2 months and adults

The National Advisory Committee on Immunization (NACI) recommendations for persons considered at an increased risk for meningococcal disease:

Chemoprophylaxis and immunoprophylaxis: Selection of meningococcal vaccination to be based upon serogroup(s):

Individuals living in the same household or with close contact (eg, kissing, shared cigarettes, shared eating or drinking utensils) of infected patient

Employees and children of nursery schools or day care

Immunoprophylaxis: Selection of meningococcal vaccination to be based upon serogroup(s):

Adolescents and young adults

Laboratory workers routinely exposed to isolates of *N. meningitidis*

Military recruits

Persons traveling to or who reside in countries where *N. meningitidis* is hyperendemic or epidemic, particularly if contact with local population will be prolonged

Persons with terminal complement component deficiencies

Persons with anatomic or functional asplenia

Note: Use is also recommended during meningococcal outbreaks caused by serogroup C.

Chemoprophylaxis:

Healthcare workers with intensive unprotected contact with infected patients

Airline passengers sitting directly next to an infected patient for duration of at least 8 hours

See NACI guidelines for specific drug treatment at http://www.phac-aspc.gc.ca/naci-ccni

Dosing: AdultsImmunization: I.M.: 0.5 mL as a single dose

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricImmunization: I.M.:

Infants:

≥2-12 months: 0.5 mL as a single dose for a total of 3 doses administered at least 4 weeks apart

≥4-11 months without prior vaccination: 0.5 mL as a single dose for a total of 2 doses administered at least 4 weeks apart

Note: The NACI recommends at least 1 of the 3 sequential doses for infants ≥2-12 months be administered beyond 5 months of age.

Children ≥1 year: Refer to adult dosing.

Administration: I.M.Administer by deep intramuscular injection only into the anterolateral thigh in infants and the deltoid area in older children, adolescents, and adults. Use separate injection sites if administering multiple vaccinations on the same day.

Administration: I.V.

Do not administer via I.V., SubQ, or I.D. routes.

StorageStore at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Upon reconstitution, use immediately.

Alternative storage: Prior to reconstitution; store up to 25°C (77°F); do not freeze. Protect from light. Use or discard within 6 months of date removed from refrigerator or upon reaching expiration date on outside packaging (whichever comes first).

Reconstitution

Menjugate® vial: Gently agitate diluent vial, then withdraw 0.6 mL of diluent and inject into Menjugate® vial. Gently shake vial until content dissolves.

Menjugate® syringe: Gently agitate diluent syringe, then inject entire content of syringe into Menjugate® vial. Gently shake vial until contents dissolves and then withdraw contents of vial back into syringe. Change needle prior to administration.

CompatibilityDo not mix with other vaccines in the same syringe.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to meningococcal group C-CRM197 conjugate vaccine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness without fever.
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.
- Diphtheria infection: Vaccine is not intended for immunization against diphtheria. Vaccinations with diphtheria toxoid should still be administered as regularly scheduled.
- Meningococcal infections: Not to be used to treat meningococcal infections or to provide immunity against *N. meningitidis* serogroups A, B, 29-E, H, I, K, L, W-135, X, Y, or Z. Vaccination against other serogroups if needed should be administered at least 2 weeks after the administration of Menjugate®.

Special populations:

Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, HIV, patients receiving chemo/radiation therapy or other immunosuppressive therapy); safety and efficacy have not been established.

Pregnancy ConsiderationsAnimal studies have not demonstrated risks to the fetus. Reproductive studies in humans have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Central nervous system: Temperature <38°C (5% to 47%), headache (34%), irritability (10% to 30%), malaise (25% adults), sleepiness (9% to 19% children), chills (13%)

Gastrointestinal: Diarrhea (8% to 18%), appetite changes (6% to 16%), nausea (16%)

Local: Injection site: Pain (22% to 81%; severe ≤2%), erythema (16% to 28%), induration (7% to 24%)

Neuromuscular & skeletal: Myalgia (29%), arthralgia (16%)

1% to 10%:

Central nervous system: Fever ≥38°C (2% to 9%), crying (unusual/persistent; up to 4%)

Dermatologic: Rash (4% to 9%)

Gastrointestinal: Vomiting (5% to 9%)

<1%, postmarketing, and/or case reports: Agitation, anaphylaxis, angioedema, bronchospasm, dizziness, facial edema, hypersensitivity reactions, hypoesthesia, hypotonia, lymphadenopathy, maculopapular rash, paresthesia, pruritus, seizure, syncope, urticaria

Drug Interactions

Immunosuppressants: Safety and immunogenicity have not been established. Reduced responses to vaccine may occur.

Vaccines: Using separate sites and syringes, may be administered concomitantly with diphtheria tetanus (DT); diphtheria tetanus and pertussis (DTaP); *Haemophilus* influenza type B (Hib); mumps, measles, and rubella (MMR); and polio virus vaccine (IPV or OPV).

Nursing: Physical Assessment/MonitoringUse caution in immunocompromised patients, patients with bleeding disorders, or those taking anticoagulants. Anaphylactoid and/or hypersensitivity reactions may occur; treatment should be available for immediate use. Note specific administration directions. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Patient EducationYou may experience mild headache, fever or chills, nausea or vomiting, or unusual sleepiness. Report persistent pain, redness, or swelling at injection site or other acute or persistent adverse reactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN = Canadian brand name]

Injection, powder for reconstitution:

Menjugate® [CAN]: 10 mcg of oligosaccharide antigen group [conjugated to diphtheria toxin protein carrier CRM 197; packaged with of diluent containing aluminum hydroxide; not available in U.S.]

Generic AvailableNo

ManufacturerNovartis Vaccines and Diagnostics S.R.L.

Mechanism of ActionInduces immunity against meningococcal disease via the formation of bactericidal antibodies directed toward the polysaccharide capsular components of *Neisseria meningitidis* serogroup C.

Index TermsMenC-CRM197; MenCC

Medication Safety Issues

Administration issue:

Menactra® (MCV) should be administered by intramuscular (I.M.) injection only. Inadvertent subcutaneous (SubQ) administration has been reported; possibly due to confusion of this product with Menomume® (MPSV), also a meningococcal polysaccharide vaccine, which is administered by the SubQ route.

Pronunciation(me NIN joe kok al pol i SAK a ride groops aye, see, why & dubl yoo won thur tee fyve dif THEER ee a TOKS oyds KON joo gate vak SEEN)

U.S. Brand NamesMenactra®

Pharmacologic CategoryVaccine, Inactivated (Bacterial)

Use: Labeled IndicationsProvide active immunization of children and adults (2-55 years of age) against invasive meningococcal disease caused by *N. meningitidis* serogroups A, C, Y, and W-135

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination of all persons 11-18 years of age at the earliest opportunity. Adolescents should be vaccinated at the 11-12 year visit. For adolescents not previously vaccinated, vaccine should be administered prior to high school entry (~15 years of age).

The ACIP also recommends vaccination for persons at increased risk for meningococcal disease. (Meningococcal conjugate vaccine [MCV] is preferred for persons aged 2-55 years; meningococcal polysaccharide vaccine [MPSV] may be used if MCV is not available). Persons at increased risk include:

College freshmen living in dormitories

Microbiologists routinely exposed to isolates of *N. meningitides*

Military recruits

Persons traveling to or who reside in countries where *N. meningitides* is hyperendemic or epidemic, particularly if contact with local population will be prolonged

Persons with terminal complement component deficiencies

Persons with anatomic or functional asplenia

Use is also recommended during meningococcal outbreaks caused by vaccine preventable serogroups.

Dosing: Adults**Immunization:** I.M.: Adults ≤55 years: 0.5 mL

Note: Revaccination: May be indicated in patients previously vaccinated with MPSV who remain at increased risk for infection. The ACIP recommends the use of MCV for revaccination, however, use of MPSV is also acceptable. The need for revaccination in patients previously vaccinated with MCV is currently under study. Adults who received MPSV ≥5 years previously, and who are still at increased risk for meningococcal disease should be revaccinated with MCV.

Dosing: ElderlySafety and efficacy not established in patients >55 years.

Dosing: Pediatric**Immunization:** I.M.: Children ≥2 years: 0.5 mL

Note: Revaccination: May be indicated in patients previously vaccinated with MPSV who remain at increased risk for infection. The ACIP recommends the use of MCV for revaccination; however, use of MPSV is also acceptable. The need for revaccination in patients previously vaccinated with MCV is currently under study. Children 2-10 years who received MPSV ≥3 years previously, or older children and adults who received MPSV ≥5 years previously, and who are still at increased risk for meningococcal disease should be revaccinated with MCV.

Administration: I.M.Administer by the intramuscular route, preferably into the upper deltoid region. For patients at risk of hemorrhage, the ACIP recommends “it should be administered intramuscularly if, in the opinion of a physician familiar with the patient's bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (≤23 gauge) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient or family should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

MCV with other inactivated vaccines: May be given simultaneously or at any interval between doses. A one month interval between tetanus toxoid, reduced diphtheria toxoid, and reduced acellular pertussis vaccine and MCV is suggested if they are not administered simultaneously

MCV with live vaccines: May be given simultaneously or at any interval between doses

Vaccine administration with antibody-containing products: MCV may be given simultaneously at different sites or at any interval between doses with antibody-containing products. Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

Administration: I.V.Do not administer via I.V., SubQ or I.D. route.

Administration: OtherFor I.M. administration only. Based on limited data, inadvertent SubQ administration provides a lower serologic response, however the response is still considered to be protective. If inadvertently administered by the SubQ route, revaccination is not necessary.

StorageStore between 2°C to 8°C (35°F to 46°F); do not freeze. Discard product exposed to freezing. Do not mix with other vaccines in the same syringe.

ContraindicationsHypersensitivity to any component of the formulation, including diphtheria toxoid; latex hypersensitivity; history of Guillain-Barré syndrome

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.
- Guillain-Barré syndrome: Risk of developing Guillain-Barré syndrome may be increased following vaccination with MCV. Persons previously diagnosed with Guillain-Barré syndrome should not be vaccinated with MCV.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.
- Meningococcal infections: Not to be used to treat meningococcal infections or to provide immunity against *N. meningitidis* serogroup B or diphtheria.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Safety and efficacy have not been established adults >55 years.
- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high dose corticosteroids); may have a reduced response to vaccination.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

Geriatric ConsiderationsMay be used though safety and efficacy have not been established in patients >55 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. An isolated teratogenic effect was observed in an animal developmental toxicity study; not necessarily vaccine related. Carcinogenic or mutagenic studies have not been performed. There are no adequate and well-controlled studies in pregnant women. Patients should contact the Sanofi Pasteur Inc vaccine registry at 1-800-822-2463 if they are pregnant or become aware they were pregnant at the time of Menactra® vaccination.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967 or www.vaers.org.**

>10%:

Central nervous system: Pain (45% to 59%), headache (36% to 41%), fatigue (30% to 35%), malaise (22% to 24%), irritability (12%), drowsiness (11%)

Gastrointestinal: Diarrhea (11% to 16%), anorexia (8% to 12%)

Local: Redness (11% to 22%), swelling (11% to 17%), induration (16% to 19%)

1% to 10%:

Central nervous system: Chills (7% to 10%), fever (2% to 5%)

Gastrointestinal: Vomiting (2% to 3%)

Local: Rash (1% to 3%)

Postmarketing and/or case reports: Acute disseminated encephalomyelitis, anaphylactic/anaphylactoid reactions, breathing difficulties, erythema, facial palsy, Guillain-Barré syndrome, hypotension, myalgia, pruritus, transverse myelitis, upper airway swelling, urticaria, vasovagal syncope, wheezing

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring Parameters Monitor for syncope for ≥15 minutes following vaccination

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [MCV; preservative free]:

Menactra®: 4 mcg each of polysaccharide antigen groups A, C, Y, and W-135 [bound to diphtheria toxoid 48 mcg] per 0.5 mL [contains natural rubber/natural latex in packaging of vials]

Generic Available No

Manufacturer Sanofi Pasteur Inc

Pricing: U.S. (www.drugstore.com)

Injection (Menactra)

(0.5): $110.20

Mechanism of Action Induces immunity against meningococcal disease via the formation of bactericidal antibodies directed toward the polysaccharide capsular components of *Neisseria meningitidis* serogroups A, C, Y and W-135.

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title and address be entered into the patient's permanent medical record.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Malaise and fatigue are common

Mental Health: Effects on Psychiatric Treatment Diarrhea is common; concomitant use with SSRIs may produce additive effects

Index Terms MCV; Meningococcal Conjugate Vaccine

Meningococcal Polysaccharide Vaccine (Groups A / C / Y and W-135)

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Administration issue:

Menomume® (MPSV) should be administered by subcutaneous (SubQ) injection. Menactra® (MCV), also a meningococcal polysaccharide vaccine, is to be administered by intramuscular (I.M.) injection only.

Pronunciation(me NIN joe kok al pol i SAK a ride vak SEEN groops aye, see, why & dubl yoo won thur tee fyve)
U.S. Brand NamesMenomune®-A/C/Y/W-135
Pharmacologic CategoryVaccine, Inactivated (Bacterial)
Use: Labeled IndicationsProvide active immunity to meningococcal serogroups contained in the vaccine
The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for persons at increased risk for meningococcal disease. (Meningococcal conjugate vaccine [MCV] is preferred for persons aged 2-55 years; meningococcal polysaccharide vaccine [MPSV] may be used if MCV is not available.) Persons at increased risk include:

College freshmen living in dormitories

Microbiologists routinely exposed to isolates of *N. meningitides*

Military recruits

Persons traveling to or who reside in countries where *N. meningitides* is hyperendemic or epidemic, particularly if contact with local population will be prolonged

Persons with terminal complement component deficiencies

Persons with anatomic or functional asplenia

Use is also recommended during meningococcal outbreaks caused by vaccine preventable serogroups.

Dosing: Adults**Immunization:** SubQ: 0.5 mL

Note: Revaccination: May be indicated in patients previously vaccinated with MPSV who remain at increased risk for infection. The ACIP recommends the use of MCV for revaccination; however, use of MPSV is also acceptable. Adults who received MPSV ≥5 years previously and who are still at increased risk for meningococcal disease should be revaccinated with MCV.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric
Immunization: SubQ:

Children <2 years: Not usually recommended. Two doses (0.5 mL/dose), 3 months apart, may be considered in children 3-18 months to elicit short-term protection against serogroup A disease. A single dose may be considered in children 19-23 months. (ACIP recommendations)

Children ≥2 years: Refer to adult dosing.

Revaccination: Children 2-10 years who received MPSV ≥3 years previously, or older children who received MPSV ≥5 years previously, and who are still at increased risk for meningococcal disease should be revaccinated with MCV.

Administration: OtherAdminister by SubQ injection; do not administer intradermally, I.M., or I.V.

Administration with other vaccines:

MPSV with other inactivated vaccines: May be given simultaneously or at any interval between doses.

MPSV with live vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: MPSV may be given simultaneously at different sites or at any interval between doses with antibody-containing products. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StoragePrior to and following reconstitution, store at 2°C to 8°C (35°F to 46°F).
ReconstitutionReconstitute using provided diluent; shake well. Use single-dose vial within 30 minutes of reconstitution. Use multidose vial within 35 days of reconstitution.
ContraindicationsHypersensitivity to any component of the formulation; defer immunization during acute illness
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Meningococcal infections: Not to be used to treat meningococcal infections or to provide immunity against *N. meningitidis* serogroup B.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Pediatrics: Use in pediatric patients <2 years of age is usually not recommended.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

- Thimerosal: Some dosage forms contain thimerosal.

Geriatric ConsiderationsNo specific data; only recommended when traveling to highly endemic areas.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have not been conducted. Based on limited data, teratogenic effects have not been reported when used during pregnancy. Pregnancy should not preclude vaccination with MPSV if indicated. Patients may contact the Sanofi Pasteur Inc vaccine registry at 1-800-822-2463 if they are pregnant or become aware they were pregnant at the time of vaccination.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.** Percentages reported in adults; incidence of erythema, swelling, or tenderness may be higher in children

>10%: Local: Tenderness (9% to 36%)

1% to 10%:

Central nervous system: Headache (2% to 5%), malaise (2%), fever (100°F to 106°F: 3%), chills (2%)

Local: Pain at injection site (2% to 3%), erythema (1% to 4%), induration (1% to 4%)

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring ParametersMonitor for syncope for ≥15 minutes following vaccination.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [MPSV]:

Menomune®-A/C/Y/W-135: 50 mcg each of polysaccharide antigen groups A, C, Y, and W-135 per 0.5 mL dose [contains lactose 2.5-5 mg/0.5 mL, natural rubber/natural latex in packaging, thimerosal in diluent for multidose vial]

Generic AvailableNo
ManufacturerSanofi Pasteur Inc
Pricing: U.S. (www.drugstore.com)

Injection (Menactra)

(1): $199.97

Mechanism of ActionInduces the formation of bactericidal antibodies to meningococcal antigens; the presence of these antibodies is strongly correlated with immunity to meningococcal disease caused by *Neisseria meningitidis* groups A, C, Y and W-135.
Pharmacodynamics/Kinetics

Onset of action: Antibody levels: 7-10 days

Duration: Antibodies against group A and C polysaccharides decline markedly (to prevaccination levels) over the first 3 years following a single dose of vaccine, especially in children <4 years of age

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title and address be entered into the patient's permanent medical record.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsMeningococcal Polysaccharide Vaccine; MPSV

Menotropins

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Repronex® may be confused with Regranex®

Pronunciation(men oh TROE pins)

U.S. Brand NamesMenopur®; Repronex®

Canadian Brand NamesMenopur®; Repronex®

Pharmacologic CategoryGonadotropin; Ovulation Stimulator

Use: Labeled IndicationsFemale:

In conjunction with hCG to induce ovulation and pregnancy in infertile females experiencing oligoanovulation or anovulation when the cause of anovulation is functional and not caused by primary ovarian failure (Repronex®)

Stimulation of multiple follicle development in ovulatory patients as part of an assisted reproductive technology (ART) (Menopur®, Repronex®)

Use: Unlabeled/InvestigationalMale: Stimulation of spermatogenesis in primary or secondary hypogonadotropic hypogonadism

Dosing: Adults

Repronex®: I.M., SubQ:

Induction of ovulation in patients with oligoanovulation (Female): Initial: 150 int. units daily for the first 5 days of treatment. Adjustments should not be made more frequently than once every 2 days and should not exceed 75-150 int. units per adjustment. Maximum daily dose should not exceed 450 int. units and dosing beyond 12 days is not recommended. If patient's response is appropriate, hCG 5000-10,000 units should be given one day following the last dose of Repronex®. Hold dose if serum estradiol is >2000 pg/mL, if the ovaries are abnormally enlarged, or if abdominal pain occurs; the patient should also be advised to refrain from intercourse. May repeat process if follicular development is inadequate or if pregnancy does not occur.

Assisted reproductive technologies (Female): Initial (in patients who have received GnRH agonist or antagonist pituitary suppression): 225 int. units; adjustments in dose should not be made more frequently than once every 2 days and should not exceed more than 75-150 int. units per adjustment. The maximum daily doses of Repronex® given should not exceed 450 int. units and dosing beyond 12 days is not recommended. Once adequate follicular development is evident, hCG (5000-10,000 units) should be administered to induce final follicular maturation in preparation for oocyte retrieval. Withhold treatment when ovaries are abnormally enlarged on last day of therapy (to reduce chance of developing OHSS).

Menopur®: SubQ: *Assisted reproductive technologies (ART):* Initial (in patients who have received GnRH agonist for pituitary suppression): 225 int. units; adjustments in dose should not be made more frequently than once every 2 days and should not exceed more than 150 int. units per adjustment. The maximum daily dose given should not exceed 450 int. units and dosing beyond 20 days is not recommended. Once adequate follicular development is evident, hCG should be administered to induce final follicular maturation in preparation for oocyte retrieval. Withhold treatment when ovaries are abnormally enlarged on last day of therapy (to reduce chance of developing OHSS).

Spermatogenesis (Male) (unlabeled use): I.M.: Following pretreatment with hCG: 75 int. units 3 times/week and hCG 2000 units twice weekly until sperm is detected in the ejaculate (4-6 months); may then be increased to menotropins 150 int. units 3 times/week

Administration: I.M.Repronex®: Administer deep in a large muscle.

Administration: OtherSubQ:

Menopur®: Administer to alternating sites of the abdomen. When administration to the lower abdomen is not possible, the injection may be given into the thigh.

Repronex®: Administer to alternating sites of the lower abdomen.

StorageLyophilized powder may be refrigerated or stored at room temperature. Protect from light.

ReconstitutionAfter reconstitution inject immediately; discard any unused portion.

ContraindicationsHypersensitivity to menotropins or any component of the formulation; primary ovarian failure as indicated by a high follicle-stimulating hormone (FSH) level; uncontrolled thyroid and adrenal dysfunction; abnormal bleeding of undetermined origin; intracranial lesion (ie, pituitary tumor); ovarian cyst or enlargement not due to polycystic ovary syndrome; infertility due to any cause other than anovulation (except candidates for *in vitro* fertilization); sex hormone-dependent tumors of the reproductive tract and accessory organs; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Ovarian enlargement: May be accompanied by abdominal distention or abdominal pain and generally regresses without treatment within 2-3 weeks. If ovaries are abnormally enlarged on the last day of treatment, withhold hCG to reduce the risk of ovarian hyperstimulation syndrome (OHSS).

- Ovarian hyperstimulation syndrome (OHSS): OHSS is characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If severe hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly with 24 hours to several days and generally occurs during the 7-10 days immediately following treatment.

- Pulmonary effects: Serious pulmonary conditions (atelectasis, acute respiratory distress syndrome, and exacerbation of asthma) have been reported.

- Thromboembolism: In association with and separate from ovarian hyperstimulation syndrome (OHSS), thromboembolic events have been reported.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; safety and efficacy have not been established.

- Renal impairment: Use with caution in patients with renal impairment; safety and efficacy have not been established.

Special populations:

- Elderly: Safety and efficacy have not been established in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Lactose: Products may contain lactose.

Other warnings/precautions:

- Experienced physician: These medications should only be used by physicians who are thoroughly familiar with infertility problems and their management.

- Multiple births: May result from the use of these medications; advise patients of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX
Pregnancy ConsiderationsEctopic pregnancy and congenital abnormalities have been reported. The incidence of congenital abnormality is similar during natural conception.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsAdverse effects may vary according to specific product, route, and/or dosage.

>10%:

Central nervous system: Headache (up to 34%)

Gastrointestinal: Abdominal pain (up to 18%), nausea (up to 12%)

Genitourinary: OHSS (up to 13%, dose related)

Local: Injection site reaction (4% to 12%)

1% to 10%:

Cardiovascular: Flushing

Central nervous system: Dizziness, malaise, migraine

Endocrine & metabolic: Breast tenderness, hot flashes, menstrual irregularities

Gastrointestinal: Abdominal cramping, abdominal fullness, constipation, diarrhea, enlarged abdomen, vomiting

Genitourinary: Ectopic pregnancy, ovarian disease, vaginal hemorrhage

Local: Injection site edema/pain

Neuromuscular & skeletal: Back pain

Respiratory: Cough increased, respiratory disorder

Miscellaneous: Infection, flu-like syndrome

Frequency not defined:

Cardiovascular: Stroke, tachycardia, thrombosis (venous or arterial)

Dermatologic: Angioedema, rash, urticaria

Genitourinary: Adnexal torsion, hemoperitoneum, ovarian enlargement

Neuromuscular & skeletal: Limb necrosis

Respiratory: Acute respiratory distress syndrome, atelectasis, dyspnea, embolism, laryngeal edema pulmonary infarction tachypnea

Miscellaneous: Allergic reaction, anaphylaxis

Drug InteractionsThere are no known significant interactions.

Monitoring ParametershCG levels, serum estradiol; vaginal ultrasound; in cases of suspected OHSS, monitor fluid intake and output, weight, hematocrit, serum and urinary electrolytes, urine specific gravity, BUN and creatinine, and abdominal girth

Nursing: Physical Assessment/MonitoringFemale: Assess knowledge/teach appropriate method for measuring basal body temperature to indicate ovulation. Stress importance of following prescriber's instructions for timing intercourse. If self-administered, assess/teach appropriate injection technique and needle disposal. **Pregnancy risk factor X:** Determine pregnancy status prior to beginning therapy.

Patient EducationSelf injection: Follow prescriber's recommended schedule for injections. Multiple ovulations resulting in multiple pregnancies have been reported. Male infertility and/or breast enlargement may occur. You may experience headache, nausea, abdominal pain, flushing, dizziness, or menstrual irregularities. Report pain at injection site; enlarged breasts (male); respiratory difficulty; nosebleeds; acute abdominal discomfort; abdominal distention; fever; or warmth, swelling, weight gain, pain, or redness in calves.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Menopur®: Follicle stimulating hormone activity 75 int. units and luteinizing hormone activity 75 int. units [packaged with diluent; contains lactose]

Repronex®: Follicle stimulating hormone activity 75 int. units and luteinizing hormone activity 75 int. units [packaged with diluent; contains lactose]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Menopur)

75 unit (1): $73.23

Solution (reconstituted) (Repronex)

75 unit (5): $363.34

Mechanism of ActionActions occur as a result of both follicle stimulating hormone (FSH) effects and luteinizing hormone (LH) effects; menotropins stimulate the development and maturation of the ovarian follicle (FSH), cause ovulation (LH), and stimulate the development of the corpus luteum (LH); in males it stimulates spermatogenesis (LH)

Pharmacodynamics/KineticsExcretion: Urine (~10% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Cantil® may be confused with Bentyl®

Pronunciation(me PEN zoe late)

U.S. Brand NamesCantil® [DSC]

Canadian Brand NamesCantil®

Pharmacologic CategoryAnticholinergic Agent; Antispasmodic Agent, Gastrointestinal

Use: Labeled IndicationsAdjunctive treatment of peptic ulcer disease

Dosing: Adults**Peptic ulcer disease:** Oral: 25-50 mg 4 times/day with meals and at bedtime

Dosing: ElderlyRefer to adult dosing.

Administration: OralMay be administered with meals.

Dietary ConsiderationsMay be taken with meals.

ContraindicationsHypersensitivity to mepenzolate or any component of the formulation; angle-closure glaucoma; obstructive uropathy (ie, bladder neck obstruction due to prostatic hyperplasia); obstructive gastrointestinal disease (ie, pyloroduodenal stenosis, achalasia); paralytic ileus; intestinal atony of the debilitated or elderly patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis or toxic megacolon complicating ulcerative colitis; myasthenia gravis; allergic or idiosyncratic reactions of related compounds

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Diarrhea: May be a sign of incomplete intestinal obstruction, treatment should be discontinued if this occurs.
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.
- Psychosis: Has been reported in patients with an extreme sensitivity to anticholinergic effects or at excessive dosages.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.
- Gastric ulcer treatment: Use of anticholinergics in gastric ulcer treatment may cause a delay in gastric emptying due to antral statis.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hiatal hernia: Use with caution in patients with hiatal hernia with reflux esophagitis.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia.
- Renal impairment: Use with caution in patients with renal impairment.
- Ulcerative colitis: Use with caution in patients with ulcerative colitis; may precipitate/aggravate toxic megacolon.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for anticholinergic effects, confusion, and hallucinations.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Tartrazine: Tablets contain tartrazine, which may cause allergic reactions in certain individuals.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsMepenzolate may suppress lactation.

Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia

Central nervous system: Headache, nervousness, drowsiness, dizziness, CNS stimulation may be produced with large doses, confusion, insomnia

Dermatologic: Dry skin, urticaria

Gastrointestinal: Constipation, xerostomia, dysphagia, nausea, vomiting, delayed gastric emptying, loss of taste

Genitourinary: Impotence, urinary hesitation, urinary retention

Neuromuscular & skeletal: Weakness

Ophthalmic: Cycloplegia, blurred vision, ocular tension increased, pupil dilation

Miscellaneous: Diaphoresis decreased, hypersensitivity reactions, anaphylaxis, lactation suppressed

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as bromide: 25 mg [contains tartrazine] [DSC]

Generic AvailableNo

Mechanism of ActionMepenzolate is a postganglionic parasympathetic inhibitor. It decreases gastric acid and pepsin secretion and suppresses spontaneous contractions of the colon.

Pharmacodynamics/Kinetics

Absorption: Oral: Low

Excretion: Urine (3% to 33%); feces

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), dry throat, dysphagia, and loss of taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause confusion, amnesia, drowsiness, nervousness, or insomnia

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive drowsiness or anticholinergic side effects (dry mouth)

Index TermsMepenzolate Bromide

International Brand NamesCantil (GB, SE); Colibantil (IT); Eftoron (JP); Tralanta (JP); Trancolon P (JP)

Meperidine and Promethazine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Mepergan may be confused with meprobamate

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(me PER i deen & proe METH a zeen)

Pharmacologic CategoryAnalgesic Combination (Opioid)

Use: Labeled IndicationsManagement of moderate pain

Dosing: AdultsAnalgesic: Oral: One capsule every 4-6 hours as needed

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: Renal Impairment**Note:** Repeated use in renal impairment **should be avoided** due to potential accumulation of neuroexcitatory meperidine metabolite.

Dosing: Hepatic ImpairmentIncreased narcotic effect in cirrhosis

RestrictionsC-II

ContraindicationsHypersensitivity to meperidine, promethazine, or any component of the formulation (cross-reactivity between phenothiazines may occur); use with or within 14 days of MAO inhibitors; pregnancy (prolonged use or high doses near term)

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).
- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); therefore, they should be used with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- CNS events: Normeperidine (an active metabolite and CNS stimulant) may accumulate and precipitate anxiety, tremors, or seizures; risk increases with renal dysfunction and cumulative dose.
- Extrapyramidal symptoms: Promethazine may cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.
- Neuroleptic malignant syndrome (NMS): Promethazine use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.
- Orthostatic hypotension: Promethazine may cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Temperature regulation: Promethazine may impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- Bone marrow suppression: Use promethazine with caution in patients with bone marrow suppression; leukopenia and agranulocytosis have been reported.
- Cardiovascular disease: Use promethazine with caution in patients with severe cardiovascular disease.
- Drug abuse: Use meperidine with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency

exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Glaucoma: Use promethazine with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Head trauma: Use meperidine with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic disorders.
- Myasthenia gravis: Use promethazine with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.
- Parkinson's disease: Use promethazine with caution in patients with parkinson's disease; may have increased risk of tardive dyskinesia.
- Prolactin-dependent tumors: Use promethazine with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Psychoses: Use with caution in patients with toxic psychoses.
- Renal impairment: Avoid repeated administration of meperidine in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: Promethazine may mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Meperidine is not recommended as a drug of first choice for the treatment of chronic pain in the elderly due to the accumulation of normeperidine; for acute pain, its use should be limited to 1-2 doses.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Pregnancy ConsiderationsSee individual agents.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsMeperidine enters breast milk; refer to Meperidine monograph for additional information. Excretion of promethazine is unknown.

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsPromethazine: **Substrate** (major) of CYP2B6, 2D6; **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Meperidine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Protease Inhibitors: May enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: Meperidine hydrochloride 50 mg and promethazine hydrochloride 25 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Meprozine)

50-25 mg (20): $15.55

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Meperidine
- Promethazine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusSedation is common; may cause nervousness or confusion; may rarely produce depression, hallucinations, or paradoxical CNS stimulation
Mental Health: Effects on Psychiatric TreatmentCYP2D6 enzyme substrate; may aggravate the adverse effects of MAO inhibitors, fluoxetine, and other serotonin uptake inhibitors. CNS depressants, tricyclic antidepressants, and phenothiazines may potentiate the effects of meperidine. Phenothiazines inhibit the ability of bromocriptine to lower serum prolactin concentrations; benztropine (and other anticholinergics) may inhibit the therapeutic response to promethazine and excess anticholinergic effects may occur.
Index TermsMepergan; Promethazine and Meperidine

Medication Safety Issues

Avoid the use of meperidine for pain control, especially in elderly and renally-compromised patients (Institute for Safe Medication Practices [ISMP], 2007)

Sound-alike/look-alike issues:

Meperidine may be confused with meprobamate

Demerol® may be confused with Demulen®, Desyrel®, dicumarol, Dilaudid®, Dymelor®, Pamelor®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(me PER i deen)

U.S. Brand NamesDemerol®

Canadian Brand NamesDemerol®

Pharmacologic Category[Analgesic, Opioid]

Use: Labeled IndicationsManagement of moderate-to-severe pain; adjunct to anesthesia and preoperative sedation

Use: Unlabeled/Investigational

Reduce postoperative shivering; reduce rigors from amphotericin

Use: DentalAdjunct in preoperative intravenous conscious sedation in patients undergoing dental surgery; alternate oral narcotic in patients allergic to codeine to treat moderate to moderate-severe pain

Dosing: Adults**Note:** The American Pain Society (2003) and ISMP (2007) do not recommend meperidine’s use as an analgesic. If use in acute pain (in patients without renal or CNS disease) cannot be avoided, treatment should be limited to ≤48 hours and doses should not exceed 600 mg/24 hours.

Pain (analgesic):

Oral: Initial: Opiate-naive: 50 mg every 3-4 hours as needed; usual dosage range: 50-150 mg every 2-4 hours as needed (manufacturers recommendation; oral route is not recommended for acute pain)

I.M., SubQ: Initial: Opiate-naive: 50-75 mg every 3-4 hours as needed; patients with prior opiate exposure may require higher initial doses.

Preoperatively: 50-100 mg given 30-90 minutes before the beginning of anesthesia

Slow I.V.: Initial: 5-10 mg every 5 minutes as needed

Dosing: Elderly**Note:** The American Pain Society (2003) and ISMP (2007) do not recommend meperidine’s use as an analgesic.

Oral: 50 mg every 4 hours

I.M.: 25 mg every 4 hours

Dosing: Pediatric**Note:** The American Pain Society (2003) and ISMP (2007) do not recommend meperidine’s use as an analgesic.

Pain (analgesic): Oral, I.M., I.V., SubQ: Children: 1-1.5 mg/kg/dose every 3-4 hours as needed; 1-2 mg/kg as a single dose preoperative medication may be used; maximum 100 mg/dose. (Oral route is not recommended for acute pain.)

Dosing: Renal Impairment

Avoid use in renal impairment.

Dosing: Hepatic ImpairmentIncreased narcotic effect in cirrhosis; reduction in dose is more important for oral than I.V. route.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Fentanyl Transdermal Conversion
- Opioid Agonist Conversion

Administration: I.V.Meperidine may be administered I.M., SubQ, or I.V. IVP should be given slowly, use of a 10 mg/mL concentration has been recommended. For continuous I.V. infusions, a more dilute solution (eg, 1 mg/mL) should be used.

Administration: I.V. DetailpH: 3.5-6.0 (adjusted)

Administration: OralAdminister syrup diluted in $^1/_2$ glass of water; undiluted syrup may exert topical anesthetic effect on mucous membranes

StorageMeperidine injection should be stored at room temperature; do not freeze. Protect from light. Protect oral dosage forms from light.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, $^1/_2NS$, NS.

Y-site administration: Compatible: Amifostine, amikacin, ampicillin, ampicillin/sulbactam, atenolol, aztreonam, bumetanide, cefamandole, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cladribine, clindamycin, co-trimoxazole, dexamethasone sodium phosphate, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, droperidol, erythromycin lactobionate, etoposide phosphate, famotidine, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, insulin (regular), kanamycin, labetalol, lidocaine, linezolid, magnesium sulfate, melphalan, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, ondansetron, oxacillin, oxytocin, paclitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, potassium chloride, propofol, propranolol, ranitidine, remifentanil, sargramostim, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, verapamil, vinorelbine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, cefoperazone, doxorubicin liposome, idarubicin, imipenem/cilastatin, minocycline. **Variable (consult detailed reference):** Acyclovir, furosemide, nafcillin.

Compatibility in syringe: Compatible: Atropine, atropine with hydroxyzine, atropine with promethazine, butorphanol, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydroxyzine, ketamine, metoclopramide, midazolam, ondansetron, pentazocine, pentazocine with perphenazine, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine, scopolamine. **Incompatible:** Heparin, morphine, pentobarbital.

Compatibility when admixed: Compatible: Cefazolin, dobutamine, metoclopramide, ondansetron, scopolamine, succinylcholine, triflupromazine, verapamil. **Incompatible:** Aminophylline, amobarbital, floxacillin, furosemide, heparin, morphine, phenobarbital, phenytoin, thiopental. **Variable (consult detailed reference):** Sodium bicarbonate.

RestrictionsC-II

ContraindicationsHypersensitivity to meperidine or any component of the formulation; use with or within 14 days of MAO inhibitors; pregnancy (prolonged use or high doses near term)

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- CNS events: Normeperidine (an active metabolite and CNS stimulant) may accumulate and precipitate anxiety, tremors, or seizures; risk increases with renal dysfunction and cumulative dose.
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic disorders.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Psychoses: Use with caution in patients with toxic psychoses.
- Renal impairment: Avoid use in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Sickle-cell disease: Use is not recommended; increased risk of normeperidine-induced seizures.
- Tachycardias: Use with caution in patients with supraventricular tachycardias.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Avoid use in the elderly.

Dosage form specific issues:

- Sulfites: Some preparations contain sulfites which may cause allergic reaction.

Other warnings/precautions:

- Abuse/misuse/diversion: Healthcare provider should be alert to problems of abuse, misuse, and diversion.

- Acute pain management: Meperidine offers no advantage over other opioids as an analgesic and has unique neurotoxicity. The use of meperidine in this setting should be avoided (American Pain Society [APS], 2003; ISMP, 2007).

- Chronic pain management: Use is not recommended for the management of chronic pain.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsMeperidine is not recommended as a drug of first choice for the treatment of chronic pain in the elderly due to the accumulation of its metabolite, normeperidine, which leads to serious CNS side effects (eg, tremor, seizures). If used for acute pain, its use should be limited to 1-2 doses.
Pregnancy Risk FactorC/D (prolonged use or high doses at term)
Pregnancy ConsiderationsMeperidine is known to cross the placenta, which may result in respiratory or CNS depression in the newborn.
LactationEnters breast milk/contraindicated (AAP rates “compatible”)
Breast-Feeding ConsiderationsMeperidine is excreted in breast milk and may cause CNS and/or respiratory depression in the nursing infant.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Central nervous system: Fatigue, drowsiness, dizziness, nervousness, headache, restlessness, malaise, confusion, mental depression, hallucinations, paradoxical CNS stimulation, increased intracranial pressure, seizure (associated with metabolite accumulation), serotonin syndrome

Dermatologic: Rash, urticaria

Gastrointestinal: Nausea, vomiting, constipation, anorexia, stomach cramps, xerostomia, biliary spasm, paralytic ileus, sphincter of Oddi spasm

Genitourinary: Ureteral spasms, decreased urination

Local: Pain at injection site

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

Miscellaneous: Histamine release, physical and psychological dependence

Oncology: VesicantNo
Metabolism/Transport Effects**Substrate** (minor) of CYP2B6, 2C19, 3A4
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Meperidine. *Risk C: Monitor therapy*

Protease Inhibitors: May enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsIncreased amylase (S), increased BSP retention, increased CPK (I.M. injections)

Monitoring ParametersPain relief, respiratory and mental status, blood pressure; observe patient for excessive sedation, CNS depression, seizures, respiratory depression

Reference RangeTherapeutic: 70-500 ng/mL (SI: 283-2020 nmol/L); Toxic: >1000 ng/mL (SI: >4043 nmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness and adverse reactions or overdose at beginning of therapy and at regular intervals with long-term use. Monitor frequently for need, may cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered), adverse reactions to report, and appropriate interventions to reduce side effects. Discontinue slowly after prolonged use.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); loss of appetite, nausea, or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report chest pain, slow or rapid heartbeat, acute dizziness or persistent headache; changes in mental status; seizures; swelling of extremities or unusual weight gain; changes in urinary elimination; acute headache; back or flank pain or muscle spasms; blurred vision; skin rash; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution, as hydrochloride [ampul]: 25 mg/0.5 mL (0.5 mL); 25 mg/mL (1 mL); 50 mg/mL (1 mL, 1.5 mL, 2 mL); 75 mg/mL (1 mL); 100 mg/mL (1 mL)

Injection, solution, as hydrochloride [prefilled syringe]: 25 mg/mL (1 mL); 50 mg/mL (1 mL); 75 mg/mL (1 mL); 100 mg/mL (1 mL)

Injection, solution, as hydrochloride [for PCA pump]: 10 mg/mL (30 mL, 50 mL [DSC], 60 mL)

Injection, solution, as hydrochloride [vial]: 25 mg/mL (1 mL); 50 mg/mL (1 mL, 30 mL); 75 mg/mL (1 mL); 100 mg/mL (1 mL, 20 mL) [may contain sodium metabisulfite]

Solution, oral, as hydrochloride: 50 mg/5 mL (500 mL)

Syrup, as hydrochloride:

Demerol®: 50 mg/5 mL (480 mL) [contains benzoic acid; banana flavor] [DSC]

Tablet, as hydrochloride: 50 mg, 100 mg

Demerol®: 50 mg, 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Meperidine HCl)

50 mg/5 mL (30): $8.99

100 mg/mL (1): $33.99

Tablets (Demerol)

50 mg (30): $45.56

100 mg (20): $54.97

Tablets (Meperidine HCl)

50 mg (20): $18.66

100 mg (20): $26.66

Mechanism of ActionBinds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression

Pharmacodynamics/Kinetics

Onset of action: Analgesic: Oral, SubQ: 10-15 minutes; I.V.: ~5 minutes

Peak effect: SubQ.: ~1 hour; Oral: 2 hours

Duration: Oral, SubQ.: 2-4 hours

Absorption: I.M.: Erratic and highly variable

Distribution: Crosses placenta; enters breast milk

Protein binding: 65% to 75%

Metabolism: Hepatic; hydrolyzed to meperidinic acid (inactive) or undergoes N-demethylation to normeperidine (active; has $^{1}/_{2}$ the analgesic effect and 2-3 times the CNS effects of meperidine)

Bioavailability: ~50% to 60%; increased with liver disease

Half-life elimination:

Parent drug: Terminal phase: Adults: 2.5-4 hours, Liver disease: 7-11 hours

Normeperidine (active metabolite): 15-30 hours; can accumulate with high doses (>600 mg/day) or with decreased renal function

Excretion: Urine (as metabolites)

Related Information

- Narcotic / Opioid Analgesics

Dental Health Professional ConsiderationsMeperidine is not to be used as the narcotic drug of first choice. It is recommended only to be used in codeine-allergic patients when a narcotic analgesic is indicated. Meperidine is not an anti-inflammatory agent. Meperidine, as with other narcotic analgesics, is recommended only for limited acute dosing (ie, 3 days or less); common adverse effects in the dental patient are nausea, sedation, and constipation. Meperidine has a significant addiction liability, especially when given long-term.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause nervousness or confusion; may rarely produce depression, hallucinations, or paradoxical CNS stimulation

Mental Health: Effects on Psychiatric TreatmentSedation is common; may cause nervousness or confusion; may rarely produce depression, hallucinations, or paradoxical CNS stimulation

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) recommend against using meperidine repetitively. The guidelines recommend fentanyl in patients who need immediate pain relief because of its rapid onset of action; fentanyl or hydromorphone is preferred in patients who are hypotensive or have renal dysfunction. Morphine or hydromorphone is recommended for intermittent, scheduled therapy. Both have a longer duration of action requiring less frequent administration.

Index TermsIsonipecaine Hydrochloride; Meperidine Hydrochloride; Pethidine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Mephobarbital may be confused with methocarbamol

Mebaral® may be confused with Medrol®, Mellaril®, Tegretol®

Pronunciation(me foe BAR bi tal)

U.S. Brand NamesMebaral®

Canadian Brand NamesMebaral®

Pharmacologic CategoryBarbiturate

Use: Labeled IndicationsSedative; treatment of grand mal and petit mal epilepsy

Dosing: Adults

Epilepsy: Oral: 200-600 mg/day in 2-4 divided doses

Sedation: Oral: 32-100 mg 3-4 times/day

Dosing: ElderlyRefer to adult dosing. Start at lowest recommended doses.

Dosing: Pediatric

Epilepsy: Oral:

Children: 6-12 mg/kg/day in 2-4 divided doses

Sedation: Oral:

Children:

<5 years: 16-32 mg 3-4 times/day

>5 years: 32-64 mg 3-4 times/day

Dosing: Renal ImpairmentUse with caution and reduce dose.

Dietary ConsiderationsHigh doses of pyridoxine may decrease drug effect; barbiturates may increase the metabolism of vitamin D & K; dietary requirements of vitamin D, K, C, B_{12}, folate and calcium may be increased with long-term use.

RestrictionsC-IV

ContraindicationsHypersensitivity to mephobarbital, other barbiturates, or any component of the formulation; pre-existing CNS depression; respiratory depression; severe uncontrolled pain; history of porphyria; pregnancy

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Geriatric ConsiderationsUsing barbiturates in the elderly may induce paradoxical stimulation, cause or aggravate depression and confusion. Due to mephobarbital's long half-life and risk of dependence, it is not a drug of choice in the elderly as a sedative/hypnotic. Interpretive guidelines from Centers for Medicare and Medicaid Services (CMS) OBRA regulations discourage the use of barbiturates as sedative/hypnotics in nursing home patients.

Pregnancy Risk FactorD

Adverse Reactions

>10%: Central nervous system: Dizziness, lightheadedness, drowsiness, “hangover” effect

1% to 10%:

Central nervous system: Confusion, mental depression, unusual excitement, nervousness, faint feeling, headache, insomnia, nightmares

Gastrointestinal: Constipation, nausea, vomiting

Metabolism/Transport Effects**Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (major); **Inhibits** CYP2C19 (weak); **Induces** CYP2A6 (weak)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 32 mg, 50 mg, 100 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Mebaral)

32 mg (100): $96.13

50 mg (100): $134.08

100 mg (100): $175.94

Mechanism of ActionIncreases seizure threshold in the motor cortex; depresses monosynaptic and polysynaptic transmission in the CNS

Pharmacodynamics/Kinetics

Onset of action: 20-60 minutes

Duration: 6-8 hours

Absorption: ~50%

Half-life elimination, serum: 34 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and drowsiness are common; may cause confusion, nervousness, depression, nightmares, or insomnia; may rarely cause hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may induce hepatic enzymes resulting in an increase or decrease effect of concurrent psychotropic; monitor to altered response

Index TermsMethylphenobarbital

Medication Safety Issues

Sound-alike/look-alike issues:

Mepivacaine may be confused with bupivacaine

Pronunciation(me PIV a kane, DEN tl)

U.S. Brand NamesCarbocaine®; Polocaine®

Canadian Brand NamesPolocaine®

Pharmacologic CategoryLocal Anesthetic

Use: DentalAmide-type anesthetic used for local infiltration anesthesia; injection near nerve trunks to produce nerve block

Dosing: Adults

Dental anesthesia, single site in upper or lower jaw: Infiltration: 54 mg (1.8 mL) as a 3% solution

Infiltration and nerve block of entire oral cavity: 270 mg (9 mL) as a 3% solution; up to a maximum of 6.6 mg/kg of body weight but not to exceed 300 mg per appointment. Manufacturer's maximum recommended dose is not more than 400 mg to normal healthy adults. The effective anesthetic dose varies with procedure, intensity of anesthesia needed, duration of anesthesia required, and physical condition of the patient. Always use the lowest effective dose along with careful aspiration.

Note: Adult and children doses of mepivacaine dental anesthetic cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 138-9.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Dental anesthetic: Infiltration and nerve block: Children <10 years: Up to 5-6 mg/kg of body weight; maximum pediatric dosage must be carefully calculated on the basis of patient's weight but must not exceed 270 mg (9 mL) of the 3% solution

Children >10 years; Refer to adult dosing.

Note: Adult and children doses of mepivacaine dental anesthetic cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 138-9.

ContraindicationsHypersensitivity to local anesthetics of the amide type or any component of the formulation

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Other warnings/precautions:

• Administration: Aspirate the syringe after tissue penetration and before injection to minimize chance of direct vascular injection.

Pregnancy Risk FactorC

Breast-Feeding ConsiderationsUsual infiltration doses of mepivacaine dental anesthetic given to nursing mothers has not been shown to affect the health of the nursing infant.

Adverse ReactionsDegree of adverse effects in the CNS and cardiovascular system is directly related to the blood levels of local anesthetic.

Cardiovascular: Myocardial effects include a decrease in contraction force as well as a decrease in electrical excitability and myocardial conduction rate resulting in bradycardia and reduction in cardiac output

Central nervous system: High blood levels result in anxiety, restlessness, disorientation, confusion, dizziness, and seizure. This is followed by depression of CNS resulting in somnolence, unconsciousness and possible respiratory arrest. In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Gastrointestinal: Nausea and vomiting may occur

Hypersensitivity reactions: May manifest as dermatologic reactions and edema at injection site. Asthmatic syndromes have occurred.

Neuromuscular & skeletal: Tremors

Psychogenic reactions: It is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injection is perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitation, hyperventilation, generalized pallor and a fainting feeling.

Drug InteractionsNo data reported

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 3% (1.8 mL) [dental cartridges]

Generic AvailableNo

Mechanism of ActionLocal anesthetics bind selectively to the intracellular surface of sodium channels to block influx of sodium into the axon. As a result, depolarization necessary for action potential propagation and subsequent nerve function is prevented. The block at the sodium channel is reversible. When drug diffuses away from the axon, sodium channel function is restored and nerve propagation returns.

Pharmacodynamics/Kinetics

Onset of action: Upper jaw: 30-120 seconds; Lower jaw: 1-4 minutes

Duration: Upper jaw: 20 minutes; Lower jaw: 40 minutes

Half-life elimination, serum: 1.9 hours

Dental Health: Effects on Dental TreatmentIt is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitations, hyperventilation, generalized pallor, and a fainting feeling.

Degree of adverse effects in the CNS and cardiovascular system is directly related to the blood levels of mepivacaine.

Frequency not defined: Bradycardia and reduction in cardiac output, nausea, vomiting, tremors, asthmatic syndromes, hypersensitivity reactions (may manifest as dermatologic reactions and edema at injection site)

High blood levels: Anxiety, restlessness, disorientation, confusion, dizziness, tremors and seizures, followed by CNS depression resulting in somnolence, unconsciousness and possible respiratory arrest. In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHigh blood levels may result in anxiety, confusion, disorientation, restlessness, or somnolence

Mental Health: Effects on Psychiatric TreatmentNone reported

Mepivacaine and Levonordefrin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(me PIV a kane & lee voe nor DEF rin)
U.S. Brand NamesCarbocaine® 2% with Neo-Cobefrin®; Polocaine® Dental with Levonordefrin; Scandonest® 2% L
Canadian Brand NamesPolocaine® 2% and Levonordefrin 1:20,000
Pharmacologic Category[Local Anesthetic]
Use: DentalAmide-type anesthetic used for local infiltration anesthesia; injection near nerve trunks to produce nerve block
Dosing: Adults

Dental (local) anesthetic:

Dental infiltration and nerve block, single site: 36 mg (1.8 mL) of mepivacaine hydrochloride as a 2% solution with levonordefrin 1:20,000

Entire oral cavity: 180 mg (9 mL) of mepivacaine hydrochloride as a 2% solution with levonordefrin 1:20,000; up to a maximum of 6.6 mg/kg of body weight but not to exceed 400 mg of mepivacaine hydrochloride per appointment. The effective anesthetic dose varies with procedure, intensity of anesthesia needed, duration of anesthesia required, and physical condition of the patient. Always use the lowest effective dose along with careful aspiration.

Note: Adult and children doses of mepivacaine hydrochloride with levonordefrin cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 139.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Dental (local) anesthetic: Infiltration and nerve block:

Children <10 years: Maximum pediatric dosage must be carefully calculated on the basis of patient's weight but should not exceed 6.6 mg/kg of body weight or 180 mg of mepivacaine hydrochloride as a 2% solution with levonordefrin 1:20,000

Children >10 years: Refer to adult dosing.

Note: Adult and children doses of mepivacaine hydrochloride with levonordefrin cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 139.

ContraindicationsHypersensitivity to local anesthetics of the amide-type or any component of the formulation
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Should be used in minimal amounts in patients with significant cardiovascular problems (because of levonordefrin component).
- Hyperthyroidism: Should be avoided in patients with uncontrolled hyperthyroidism.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.
- Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.
- Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.
- Pediatrics: Use with caution in children; reduce dose consistent with age and physical status.

Dosage form specific issues:

- Sodium bisulfite: Contains sodium bisulfite which may cause allergic reactions in some individuals.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.
- Trained personnel: Dental practitioners using local anesthetic agents should be well trained in diagnosis and management of

emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC

Breast-Feeding ConsiderationsUsual infiltration doses of mepivacaine with levonordefrin given to nursing mothers has not been shown to affect the health of the nursing infant.

Adverse ReactionsDegree of adverse effects in the CNS and cardiovascular system is directly related to the blood levels of mepivacaine. The effects below are more likely to occur after systemic administration rather than infiltration.

Cardiovascular: Myocardial effects include a decrease in contraction force as well as a decrease in electrical excitability and myocardial conduction rate resulting in bradycardia and reduction in cardiac output.

Central nervous system: High blood levels result in anxiety, restlessness, disorientation, confusion, dizziness, and seizure. This is followed by depression of CNS resulting in somnolence, unconsciousness and possible respiratory arrest. In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Gastrointestinal: Nausea and vomiting may occur

Hypersensitivity reactions: Extremely rare, but may be manifest as dermatologic reactions and edema at injection site. Asthmatic syndromes have occurred. Patients may exhibit hypersensitivity to bisulfites contained in local anesthetic solution to prevent oxidation of levonordefrin. In general, patients reacting to bisulfites have a history of asthma and their airways are hyper-reactive to asthmatic syndrome.

Neuromuscular & skeletal: Tremors

Psychogenic reactions: It is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitation, hyperventilation, generalized pallor and a fainting feeling.

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Carbocaine® 2% with Neo-Cobefrin®: Mepivacaine hydrochloride 2% and levonordefrin 1:20,000 (1.8 mL) [dental cartridges; contains sodium bisulfite]

Polocaine® Dental with Levonordefrin: Mepivacaine hydrochloride 2% and levonordefrin 1:20,000 (1.8 mL) [dental cartridges; contains sodium metabisulfite]

Scandonest® 2% L: Mepivacaine hydrochloride 2% and levonordefrin 1:20,000 (1.7 mL) [dental cartridges; contains sodium metabisulfite]

Generic AvailableNo

Mechanism of ActionLocal anesthetics bind selectively to the intracellular surface of sodium channels to block influx of sodium into the axon. As a result, depolarization necessary for action potential propagation and subsequent nerve function is prevented. The block at the sodium channel is reversible. When drug diffuses away from the axon, sodium channel function is restored and nerve propagation returns.

Levonordefrin prolongs the duration of the anesthetic actions of mepivacaine by causing vasoconstriction (alpha-adrenergic receptor agonist) of the vasculature surrounding the nerve axons. This prevents the diffusion of mepivacaine away from the nerves resulting in a longer retention in the axon.

Pharmacodynamics/Kinetics

Duration: Upper jaw: 1-2.5 hours; Lower jaw: 2.5-5.5 hours

Infiltration: 50 minutes

Inferior alveolar block: 60-75 minutes

Dental Health: Effects on Dental Treatment It is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitations, hyperventilation, generalized pallor and a fainting feeling. Patients may exhibit hypersensitivity to bisulfites contained in local anesthetic solution to prevent oxidation of levonordefrin. In general, patients reacting to bisulfites have a history of asthma and their airways are hyper-reactive to asthmatic syndrome.

Degree of adverse effects in the CNS and cardiovascular system is directly related to the blood levels of mepivacaine (frequency not defined; more likely to occur after systemic administration rather than infiltration): Bradycardia and reduction in cardiac output, nausea, vomiting, tremors, hypersensitivity reactions (extremely rare; may be manifest as dermatologic reactions and edema at injection site), asthmatic syndromes

High blood levels: Anxiety, restlessness, disorientation, confusion, dizziness, and seizures, followed by CNS depression resulting in somnolence, unconsciousness and possible respiratory arrest.

In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status High blood levels may result in anxiety, confusion, disorientation, restlessness, or somnolence

Mental Health: Effects on Psychiatric Treatment Use with tricyclic antidepressants or MAO inhibitors could result in increased pressor response secondary to the levonordefrin component. Use with propranolol could result in serious hypertension and reflex bradycardia.

Index Terms Levonordefrin and Mepivacaine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Mepivacaine may be confused with bupivacaine

Polocaine® may be confused with prilocaine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(me PIV a kane)

U.S. Brand NamesCarbocaine®; Polocaine®; Polocaine® Dental; Polocaine® MPF; Scandonest® 3% Plain

Canadian Brand NamesCarbocaine®; Polocaine®

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsLocal or regional analgesia; anesthesia by local infiltration, peripheral and central neural techniques including epidural and caudal blocks; **not** for use in spinal anesthesia

Use: DentalLocal anesthesia by nerve block, infiltration in dental procedures

Dosing: Adults

Injectable local anesthetic: Dose varies with procedure, degree of anesthesia needed, vascularity of tissue, duration of anesthesia required, and physical condition of patient. The smallest dose and concentration required to produce the desired effect should be used.

Maximum dose: 400 mg; do not exceed 1000 mg/24 hours

Cervical, brachial, intercostal, pudenal nerve block: 5-40 mL of a 1% solution (maximum: 400 mg) **or** 5-20 mL of a 2% solution (maximum: 400 mg). For pudenal block, inject $^1/_2$ the total dose each side.

Transvaginal block (paracervical plus pudenal): Up to 30 mL (both sides) of a 1% solution (maximum: 300 mg). Inject $^1/_2$ the total dose each side.

Paracervical block: Up to 20 mL (both sides) of a 1% solution (maximum: 200 mg). Inject $^1/_2$ the total dose to each side. This is the maximum recommended dose per 90-minute procedure; inject slowly with 5 minutes between sides.

Caudal and epidural block (preservative free solutions only): 15-30 mL of a 1% solution (maximum: 300 mg) **or** 10-25 mL of a 1.5% solution (maximum: 375 mg) **or** 10-20 mL of a 2% solution (maximum: 400 mg)

Infiltration: Up to 40 mL of a 1% solution (maximum: 400 mg)

Therapeutic block (pain management): 1-5 mL of a 1% solution (maximum: 50 mg) **or** 1-5 mL of a 2% solution (maximum: 100 mg)

Dental anesthesia:

Single site in upper or lower jaw: 54 mg (1.8 mL) as a 3% solution

Infiltration and nerve block of entire oral cavity: 270 mg (9 mL) as a 3% solution. Manufacturer's maximum recommended dose is not more than 400 mg to normal healthy adults.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Injectable local anesthetic:** Dose varies with procedure, degree of anesthesia needed, vascularity of tissue, duration of anesthesia required, and physical condition of patient. The smallest dose and concentration required to produce the desired effect should be used.

Maximum dose: 5-6 mg/kg; only concentrations <2% should be used in children <3 years or <14 kg (30 lbs)

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Brief exposure up to 40°C (104°F) does not adversely affect the product. Solutions may be sterilized. Dental solutions should be protected from light.

ContraindicationsHypersensitivity to mepivacaine, other amide-type local anesthetics, or any component of the formulation

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.
- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.
- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Acutely ill patients: Use with caution in acutely ill patients; dose reduction may be required.
- Debilitated patients: Use with caution in debilitated patients; dose reduction may be required.
- Elderly: Use with caution in the elderly; dose reduction may be required.

Dosage form specific issues:

- Preservative-containing solutions: Do not use solutions containing preservatives for caudal or epidural block.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.
- Test dose: A test dose is recommended prior to epidural administration and all reinforcing doses with continuous catheter technique.
- Trained personnel: Dental practitioners and/or clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Mepivacaine has been used in obstetrical analgesia.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsDegree of adverse effects in the CNS and cardiovascular system is directly related to the blood levels of mepivacaine, route of administration, and physical status of the patient. The effects below are more likely to occur after systemic administration rather than infiltration.

Cardiovascular: Bradycardia, cardiac arrest, cardiac output decreased, heart block, hyper-/hypotension, myocardial depression, syncope, tachycardia, ventricular arrhythmias

Central nervous system: Anxiety, chills, convulsions, depression, dizziness, excitation, restlessness, tremors

Dermatologic: Angioneurotic edema, diaphoresis, erythema, pruritus, urticaria

Gastrointestinal: Fecal incontinence, nausea, vomiting

Genitourinary: Incontinence, urinary retention

Neuromuscular & skeletal: Paralysis

Ocular: Blurred vision, pupil constriction

Otic: Tinnitus

Respiratory: Apnea, hypoventilation, sneezing

Miscellaneous: Allergic reaction, anaphylactoid reaction

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersVital signs, state of consciousness; signs of CNS toxicity
Nursing: Physical Assessment/MonitoringMonitor for effectiveness of anesthesia and adverse reactions. Monitor for return of sensation. **Oral:** Use caution to prevent gagging or choking and avoid food or drink for 1 hour. Teach patient adverse reactions to report; use and teach appropriate interventions to promote safety.
Patient EducationYou will experience decreased sensation to pain, heat, or cold in the area and/or decreased muscle strength (depending on area of application) until effects wear off; use necessary caution to reduce incidence of possible injury until full sensation returns. Report irritation, pain, burning at injection site; chest pain or palpitations; or respiratory difficulty.

Oral injection: This will cause numbness of your mouth. Do not eat or drink for 1 hour after use. Take small sips of water at first to ensure that you can swallow without difficulty. Your tongue and/or mouth may be numb, use caution to avoid biting yourself. Report irritation, pain, burning at injection site; chest pain or palpitations; or respiratory difficulty.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride [contains methylparabens]:

Carbocaine®: 1% (50 mL); 2% (50 mL)

Polocaine®: 1% (50 mL); 2% (50 mL)

Scandonest® 3% Plain: 3% (1.7 mL) [dental cartridge]

Injection, solution, as hydrochloride [preservative free]:

Carbocaine®: 1% (30 mL); 1.5% (30 mL); 2% (20 mL); 3% (1.8 mL) [dental cartridge]

Polocaine® Dental: 3% (1.8 mL) [dental cartridge]

Polocaine® MPF: 1% (30 mL); 1.5% (30 mL); 2% (20 mL)

Generic AvailableNo

Mechanism of ActionMepivacaine is an amide local anesthetic similar to lidocaine; like all local anesthetics, mepivacaine acts by preventing the generation and conduction of nerve impulses

Pharmacodynamics/Kinetics

Onset of action (route and dose dependent): Range: 3-20 minutes

Duration (route and dose dependent): 2-2.5 hours

Protein binding: ~75%

Metabolism: Primarily hepatic via N-demethylation, hydroxylation, and glucuronidation

Half-life elimination: Neonates: 8.7-9 hours; Adults: 1.9-3 hours

Excretion: Urine (95% as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Degree of adverse effects in the CNS and cardiovascular system is directly related to blood levels of mepivacaine (frequency not defined; more likely to occur after systemic administration rather than infiltration): Bradycardia, cardiovascular collapse, hypotension, myocardial depression, ventricular arrhythmias, nausea, vomiting, respiratory arrest, anaphylactoid reactions, blurred vision, heart block, transient stinging or burning at injection site

High blood levels: Anxiety, restlessness, disorientation, confusion, dizziness, and seizures, followed by CNS depression resulting in somnolence, unconsciousness, and possible respiratory arrest.

In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause anxiety, restlessness, confusion, drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations

Local anesthetic toxicity: Cardiac arrest: Lipid infusion has been used in animal studies and several human cases (Bupivacaine: Rosenblatt, 2006; Levobupivacaine: Foxall, 2007; Ropivacaine: Litz, 2006) where cardiovascular toxicity, unresponsive to conventional resuscitation, resulted. Additional information is available at http://www.lipidrescue.org. The protocol from the website is: **20% Fat Emulsion:** 1.5 mL/kg administered over 1 minute, followed immediately by an infusion of 0.25 mL/kg/minute. Continue chest compressions (lipid must circulate). Repeat bolus every 3-5 minutes up to 3 mL/kg total dose until circulation restored. Continue infusion until hemodynamic stability is restored. Increase the infusion rate to 0.5 mL/kg/minute if BP declines. A maximum total dose of 8 mL/kg is recommended.

Index TermsMepivacaine Hydrochloride

Jump To Field (Select Field Name)

Pronunciation(me proe BA mate & AS pir in)

U.S. Brand NamesEquagesic®

Canadian Brand Names292 MEP®

Pharmacologic CategoryAntianxiety Agent, Miscellaneous; Salicylate

Use: Labeled IndicationsAdjunct to the short-term treatment of pain in patients with skeletal-muscular disease exhibiting tension and/or anxiety

Dosing: Adults**Pain with muscular disorders/anxiety (adjunct):** Oral: 1-2 tablet 3-4 times/day for up to 10 days

Dosing: ElderlyRefer to adult dosing and dosing in individual agents; use with caution.

Dosing: Pediatric

Pain with muscular disorders/anxiety (adjunct): Oral: Children ≥12 years: Refer to adult dosing.

Dietary ConsiderationsMay be taken with food to minimize GI upset.

RestrictionsC-IV

ContraindicationsHypersensitivity to aspirin, meprobamate, carisoprodol, NSAIDs, other related compounds, or any component of the formulation; acute intermittent porphyria; asthma; rhinitis; nasal polyps; children or teenagers for viral infections (chickenpox or flu symptoms), with or without fever, due to a potential association with Reye's syndrome; pregnancy, breast-feeding

Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: May occur in patients with history of dermatological condition (usually by fourth dose).
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.
- Tinnitus: Discontinue use if tinnitus or impaired hearing occurs.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.
- Depression: Use with caution in patients with depression or suicidal tendencies.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Heavy ethanol use (>3 drinks/day) can increase bleeding risks.
- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer disease.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Abrupt discontinuation: May precipitate withdrawal.

Also refer to individual agents.

Pregnancy Risk FactorX
Pregnancy ConsiderationsSee indiivudal agents.
LactationEnters breast milk/contraindicated
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsAspirin: **Substrate** of CYP2C9 (minor)
Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusSedation is common
Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; may displace valproic acid from binding sites resulting in an increase of unbound drug; monitor for toxicity; meprobamate is a CNS depressant; monitor for

additive effects with concurrent psychotropic use

Medication Safety Issues

Sound-alike/look-alike issues:

Meprobamate may be confused with Mepergan, meperidine

Equanil may be confused with Elavil®

Pronunciation(me proe BA mate)
U.S. Brand NamesMiltown® [DSC]
Canadian Brand NamesNovo-Mepro
Pharmacologic CategoryAntianxiety Agent, Miscellaneous
Use: Labeled IndicationsManagement of anxiety disorders
Use: Unlabeled/InvestigationalDemonstrated value for muscle contraction, headache, premenstrual tension, external sphincter spasticity, muscle rigidity, opisthotonos-associated with tetanus
Use: DentalTreatment of muscle spasm associated with acute temporomandibular joint (TMJ) pain; management of dental anxiety disorders
Dosing: Adults**Anxiety:** Oral: 400 mg 3-4 times/day, up to 2400 mg/day
Dosing: ElderlyOral (use lowest effective dose): Initial: 200 mg 2-3 times/day
Dosing: Pediatric**Anxiety:** Oral: 6-12 years: 100-200 mg 2-3 times/day
Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 9-12 hours.

Cl_{cr} <10 mL/minute: Administer every 12-18 hours.

Moderately dialyzable (20% to 50%)

Dosing: Hepatic ImpairmentProbably necessary in patients with liver disease; no specific recommendations.
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

RestrictionsC-IV
ContraindicationsHypersensitivity to meprobamate, related compounds (including carisoprodol), or any component of the formulation; acute intermittent porphyria; pre-existing CNS depression; narrow-angle glaucoma; severe uncontrolled pain; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: May occur in patients with history of dermatological condition (usually by fourth dose).
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Depression: Use with caution in patients with depression or suicidal tendencies.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may cause confusion, cognitive impairment, or excessive sedation.

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Other warnings/precautions:

- Abrupt discontinuation: May precipitate withdrawal.

Geriatric ConsiderationsMeprobamate is not considered a drug of choice in the elderly because of its potential to cause physical and psychological dependence. Interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) strongly discourage the use of meprobamate in residents of long-term care facilities.
Pregnancy Risk FactorD
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsBreast milk concentrations are higher than plasma; effects are unknown.
Adverse ReactionsFrequency not defined.

Cardiovascular: Syncope, peripheral edema, palpitation, tachycardia, arrhythmia

Central nervous system: Drowsiness, ataxia, dizziness, paradoxical excitement, confusion, slurred speech, headache, euphoria, chills, vertigo, paresthesia, overstimulation

Dermatologic: Rashes, purpura, dermatitis, Stevens-Johnson syndrome, petechiae, ecchymosis

Gastrointestinal: Diarrhea, vomiting, nausea

Hematologic: Leukopenia, eosinophilia, agranulocytosis, aplastic anemia

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, impairment of accommodation

Renal: Renal failure

Respiratory: Wheezing, dyspnea, bronchospasm, angioneurotic edema

Drug Interactions

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersMental status
Reference RangeTherapeutic: 6-12 mcg/mL (SI: 28-55 µmol/L); Toxic: >60 mcg/mL (SI: >275 µmol/L)
Nursing: Physical Assessment/MonitoringAssess other medications the patient may be taking for effectiveness and interactions. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. Monitor therapeutic effectiveness and adverse reactions or overdose at beginning of therapy and periodically with long-term use. Monitor for CNS depression. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationTake exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. Do not use alcohol or other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent CNS effects, skin rash or irritation, changes in urinary pattern, wheezing or respiratory difficulty, or worsening of condition. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 200 mg, 400 mg [DSC]

Miltown®: 200 mg, 400 mg [DSC]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Miltown)

200 mg (30): $69.83

Mechanism of ActionAffects the thalamus and limbic system; also appears to inhibit multineuronal spinal reflexes
Pharmacodynamics/Kinetics

Onset of action: Sedation: ~1 hour

Distribution: Crosses placenta; enters breast milk

Metabolism: Hepatic

Half-life elimination: 10 hours

Excretion: Urine (8% to 20% as unchanged drug); feces (10% as metabolites)

Pharmacotherapy PearlsWithdrawal should be gradual over 1-2 weeks. Benzodiazepine and buspirone are better choices for treatment of anxiety disorders.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Anesthesia and Critical Care Concerns/Other ConsiderationsWithdrawal should be gradual over 1-2 weeks. Benzodiazepines and buspirone are better choices for treatment of anxiety disorders.

Index TermsEquanil

Mequinol and Tretinoin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ME kwi nole & TRET i noyn)

U.S. Brand NamesSolagé®

Canadian Brand NamesSolagé®

Pharmacologic CategoryRetinoic Acid Derivative; Vitamin A Derivative; Vitamin, Topical

Use: Labeled IndicationsTreatment of solar lentigines; the efficacy of using Solagé® daily for >24 weeks has not been established

Dosing: Adults**Solar lentigines:** Topical: Apply twice daily to solar lentigines using the applicator tip while avoiding application to the surrounding skin. Separate application by at least 8 hours or as directed by physician.

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalUse applicator tip. Avoid application to surrounding skin, eyes, mouth, paranasal creases, or mucous membranes.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light; store in original carton. Flammable, keep away from heat and open flame.

ContraindicationsHypersensitivity to mequinol, tretinoin, or any component of the formulation; pregnancy, women of childbearing potential

Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity: Discontinue if hypersensitivity is noted.
- Photosensitivity: Avoid sun (including sun lamps) or use protective clothing. Do not use in sunburned patients until they have fully recovered. Use extreme caution in patients who have significant exposure to the sun through their occupation. Not to be taken with photosensitizing drugs (eg, thiazides, tetracyclines, fluoroquinolones, phenothiazines, sulfonamides).
- Skin irritation: May cause irritation, erythema, burning, stinging, tingling, peeling and/or pruritus; may cause severe irritation of eczematous skin.

Disease-related concerns:

- Eczema: Use extreme caution in eczematous skin conditions.
- Moderately/heavily pigmented skin: Safety and efficacy have not been established in moderately or heavily pigmented skin.
- Vitiligo: Use with caution in patients with history or family history of vitiligo.

Special populations:

- Pediatrics: Do not use in children.

Other warnings/precautions:

- Appropriate use: For external use only; no bathing or showering for at least 6 hours after application. Avoid application to the eyes, mouth, paranasal creases, and mucous membranes.
- Chronic use: Effects of chronic use (>52 weeks) are unknown.
- Weather extremes: Wind and cold may be irritating.

Pregnancy Risk FactorX

Pregnancy ConsiderationsMay cause fetal harm when administered to a pregnant woman.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Dermatologic: Erythema (41%), burning, stinging or tingling (18%), desquamation (12%), pruritus (10%)

1% to 10%: Dermatologic: Skin irritation (6%), halo hypopigmentation (6%), hypopigmentation (4%), skin discomfort (4%), dry skin (3%), crusting (2%), dermatitis (2%), rash (2%), vesicular bullae rash (1%), contact allergic reaction (1%), irritant dermatitis (1%)

Metabolism/Transport EffectsTretinoin: **Substrate** (minor) of CYP2A6, 2B6, 2C8/9; **Inhibits** CYP2C8/9 (weak); **Induces** CYP2E1 (weak)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersIf patient experiences significant local irritation (redness, burning, stinging, peeling, or itching) then direct patient to use less medication, decrease frequency of use, discontinue temporarily, or discontinue altogether.

Nursing: Physical Assessment/Monitoring

See individual agent for Tretinoin (Topical).

Patient Education

See individual agent for Tretinoin (Topical).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, topical:

Solagé®: Mequinol 2% and tretinoin 0.01% (30 mL) [contains alcohol 78%; dispensed in applicator bottle]

Generic AvailableNo
ManufacturerContract Pharmaceutical Laboratories
Pricing: U.S. (www.drugstore.com)

Solution (Solage)

2-0.01% (30): $168.67

Mechanism of ActionSolar lentigines are localized, pigmented, macular lesions of the skin on areas of the body chronically exposed to the sun. Mequinol is a substrate for the enzyme tyrosinase and acts as a competitive inhibitor of the formation of melanin precursors. The mechanisms of depigmentation for both drugs is unknown.
Pharmacodynamics/Kinetics

Absorption: Percutaneous absorption was 4.4% of tretinoin when applied as 0.8 mL of Solagé® to a 400 cm^2 area of the back

Time to peak: Mequinol: 2 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentPhotosensitizing drugs such as psychotropics can further increase sun sensitivity; avoid concurrent use
Index TermsSolage; Tretinoin and Mequinol
International Brand NamesSolagé® (CA)

Mercaptopurine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Purinethol® may be confused with propylthiouracil

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

To avoid potentially serious dosage errors, the terms “6-mercaptopurine” or “6-MP” should be avoided; use of these terms has been associated with sixfold overdosages.

Azathioprine is metabolized to mercaptopurine; concurrent use of these commercially-available products has resulted in profound myelosuppression.

Pronunciation(mer kap toe PYOOR een)

U.S. Brand NamesPurinethol®

Canadian Brand NamesPurinethol®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite; Immunosuppressant Agent

Use: Labeled IndicationsTreatment (maintenance and induction) of acute lymphoblastic leukemia (ALL)

Use: Unlabeled/InvestigationalSteroid-sparing agent for corticosteroid-dependent Crohn’s disease (CD) and ulcerative colitis (UC); maintenance of remission in CD; fistulizing Crohn’s disease

Dosing: Adults Refer to individual protocols.

ALL:

Induction: Oral: 2.5-5 mg/kg/day (100-200 mg)

Maintenance: Oral: 1.5-2.5 mg/kg/day **or** 80-100 mg/m^2/day given once daily

Note: In ALL, administration in the evening (vs morning administration) may lower the risk of relapse.

Reduction of steroid use in CD or UC, maintenance of remission in CD or fistulizing disease (unlabeled uses): Oral: Initial: 50 mg daily; may increase by 25 mg/day every 1-2 weeks as tolerated to target dose of 1-1.5 mg/kg/day

Dosage adjustment with concurrent allopurinol: Reduce mercaptopurine dosage to $^1/_4$ to $^1/_3$ the usual dose.

Dosage adjustment in TPMT-deficiency: Not established; substantial reductions are generally required only in homozygous deficiency.

Dosing: ElderlyDue to renal decline with age, start with lower recommended doses for adults.

Dosing: Pediatric**ALL:** Refer to individual protocols: Oral:

Induction: 2.5-5 mg/kg/day **or** 70-100 mg/m^2/day given once daily

Maintenance: 1.5-2.5 mg/kg/day **or** 50-75 mg/m^2/day given once daily

Note: In ALL, administration in the evening (vs morning administration) may lower the risk of relapse.

Dosing: Renal ImpairmentThe FDA-approved labeling recommends starting with reduced doses in patients with renal impairment to avoid accumulation; however, specific guidelines are not available. The following guidelines have been used by some clinicians (Aronoff, 2007): Children:

Cl_{cr} <50 mL/minute: Administer every 48 hours

Hemodialysis: Administer every 48 hours

Continuous ambulatory peritoneal dialysis (CAPD): Administer every 48 hours

Continuous renal replacement therapy (CRRT): Administer every 48 hours

Dosing: Hepatic ImpairmentThe FDA-approved labeling recommends considering a reduced dose in patients with hepatic impairment; however, specific guidelines are not available.

Dosing: Combination Regimens

Leukemia, acute lymphocytic:

Hyper-CVAD (Leukemia, Acute Lymphocytic)

MTX/6-MP/VP (Maintenance)

POMP

PVA (POG 8602)

Leukemia, acute promyelocytic: Tretinoin-Idarubicin

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: OralPreferably on an empty stomach (1 hour before or 2 hours after meals)
Dietary ConsiderationsShould not be administered with meals.
StorageStore at room temperature of 15°C to 25°C (59°F to 77°F). Protect from moisture.
Extemporaneously PreparedA 50 mg/mL oral suspension can be prepared by crushing thirty 50 mg tablets in a mortar, and then mixing in a small amount of vehicle (a 1:1 combination of methylcellulose 1% and syrup) to create a uniform paste. Add a sufficient quantity of vehicle to make 30 mL of suspension. Label “shake well.” Room temperature stability is 14 days.

Dressman JB and Poust RI, “Stability of Allopurinol and of Five Antineoplastics in Suspension,” *Am J Hosp Pharm*, 1983, 40:616-8.

Nahata MC, Morosco RS, and Hipple TF, 4th ed, *Pediatric Drug Formulations*, Cincinnati, OH: Harvey Whitney Books Co, 2000.

ContraindicationsHypersensitivity to mercaptopurine or any component of the formulation; patients whose disease showed prior resistance to mercaptopurine or thioguanine; severe liver disease, severe bone marrow suppression; pregnancy
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hepatotoxicity: May occur; use with caution with other hepatotoxic drugs or in dosages >2.5 mg/kg/day.
- Infection: Common signs of infection, such as fever and leukocytosis may not occur; lethargy and confusion may be more prominent signs of infection.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with prior bone marrow suppression.
- Thiopurine methyltransferase deficiency: Patients with genetic deficiency of thiopurine methyltransferase (TPMT) may be sensitive to myelosuppressive effects.

Concurrent drug therapy issues:

- Azathioprine: Because azathioprine is metabolized to mercaptopurine, concomitant use with azathioprine may result in profound myelosuppression and should be avoided.
- TPMT or xanthine oxidase inhibitors: Patients on concurrent therapy with drugs which may inhibit TPMT (eg, olsalazine) or xanthine oxidase (eg, allopurinol) may be sensitive to myelosuppressive effects.

Other warnings/precautions:

- Error-prone terms: To avoid potentially serious dosage errors, the terms “6-mercaptopurine” or “6-MP” should be avoided; use of these terms has been associated with sixfold overdosages.
- Vaccines: Immune response to vaccines may be diminished.

Geriatric ConsiderationsToxicity to immunosuppressives is increased in the elderly. Start with lowest recommended adult doses. Signs of infection, such as fever and WBC rise, may not occur. Lethargy and confusion may be more prominent signs of infection.
Pregnancy Risk FactorD
LactationEnters breast milk/contraindicated
Adverse Reactions

>10%:

Hematologic: Myelosuppression; leukopenia, thrombocytopenia, anemia

Onset: 7-10 days

Nadir: 14-16 days

Recovery: 21-28 days

Hepatic: Intrahepatic cholestasis and focal centralobular necrosis (40%), characterized by hyperbilirubinemia, increased alkaline phosphatase and AST, jaundice, ascites, encephalopathy; more common at doses >2.5 mg/kg/day. Usually occurs within 2 months of therapy but may occur within 1 week, or be delayed up to 8 years.

1% to 10%:

Central nervous system: Drug fever

Dermatologic: Hyperpigmentation, rash

Endocrine & metabolic: Hyperuricemia

Gastrointestinal: Nausea, vomiting, diarrhea, stomatitis, anorexia, stomach pain, mucositis

Renal: Renal toxicity

<1%: Alopecia, dry and scaling rash, glossitis, oligospermia, tarry stools, eosinophilia

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

5-ASA Derivatives: May decrease the metabolism of Thiopurine Analogs. *Risk C: Monitor therapy*

Allopurinol: May decrease the metabolism of Mercaptopurine. *Risk D: Consider therapy modification*

AzaTHIOprine: May enhance the myelosuppressive effect of Mercaptopurine. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Mercaptopurine may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Monitoring ParametersCBC with differential and platelet count, liver function tests, uric acid, urinalysis; TPMT genotyping may identify individuals at risk for toxicity

For use as immunomodulatory therapy in CD or UC, monitor CBC with differential weekly for 1 month, then biweekly for 1 month, followed by monitoring every 1-2 months throughout the course of therapy. LFTs should be assessed every 3 months.

Nursing: Physical Assessment/MonitoringDo not use the terms "6-mercaptopurine" or "6-MP" when writing prescriptions; use of these terms has been associated with sixfold overdosage. Assess potential for interactions with other pharmacological agents patient may be taking (increased potential for liver toxicity or mercaptopurine toxicity). Assess results of laboratory tests, therapeutic response, and adverse reactions (eg, hepatic function, jaundice, ascites, encephalopathy can occur some time following therapy; nutritional status, dehydration; myelosuppression, anemia, leukopenia; and renal status) on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential, platelet count, liver function, uric acid, renal function

For use as immunomodulatory therapy in CD or UC, monitor CBC with differential weekly for 1 month, then biweekly for 1 month, followed by monitoring every 1-2 months throughout the course of therapy. LFTs should be assessed every 3 months.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take daily dose at the same time each day. Preferable to take an on empty stomach, 1 hour before or 2 hours after meals. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea and vomiting, diarrhea, or loss of appetite (small, frequent meals may help/request medication); weakness or lethargy (use caution when driving or engaging in tasks that require alertness until response to drug is known); mouth sores; or headache (consult prescriber for approved medications). Report signs of persistent fever; opportunistic infection (eg, fever, chills, sore throat, burning urination, fatigue); bleeding (eg, tarry stools, easy bruising); unresolved mouth sores; nausea or vomiting; swelling of extremities; respiratory difficulty; unusual weight gain; or changes in urinary pattern. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [scored]: 50 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Mercaptopurine)

50 mg (30): $92.99

Tablets (Purinethol)

50 mg (30): $150.13

Mechanism of ActionPurine antagonist which inhibits DNA and RNA synthesis; acts as false metabolite and is incorporated into DNA and RNA, eventually inhibiting their synthesis; specific for the S phase of the cell cycle

Pharmacodynamics/Kinetics

Absorption: Variable and incomplete (16% to 50%)

Distribution: V_d = total body water; CNS penetration is poor

Protein binding: 19%

Metabolism: Hepatic and in GI mucosa; hepatically via xanthine oxidase and methylation via TPMT to sulfate conjugates, 6-thiouric acid, and other inactive compounds; first-pass effect

Half-life elimination (age dependent): Children: 21 minutes; Adults: 47 minutes

Time to peak, serum: ~2 hours

Excretion: Urine (46% as mercaptopurine and metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis and mucositis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine or carbamazepine

Index Terms6-Mercaptopurine (error-prone abbreviation); 6-MP (error-prone abbreviation); NSC-755

Meropenem

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Meropenem may be confused with ertapenem, imipenem, metronidazole.

Pronunciation(mer oh PEN em)
U.S. Brand NamesMerrem® I.V.
Canadian Brand NamesMerrem®
Pharmacologic CategoryAntibiotic, Carbapenem
Use: Labeled IndicationsTreatment of intra-abdominal infections (complicated appendicitis and peritonitis); treatment of bacterial meningitis in pediatric patients ≥3 months of age caused by *S. pneumoniae*, *H. influenzae*, and *N. meningitidis*; treatment of complicated skin and skin structure infections caused by susceptible organisms
Use: Unlabeled/Investigational*Burkholderia pseudomallei* (melioidosis), febrile neutropenia, liver abscess, meningitis (adults), otitis externa, pneumonia, urinary tract infections
Dosing: Adults

Burkholderia pseudomallei*(melioidosis) (unlabeled use),*Pseudomonas: 1 g every 8 hours

Cholangitis, intra-abdominal infections: 1 g every 8 hours

Febrile neutropenia, otitis externa, pneumonia (unlabeled uses): 1 g every 8 hours

Liver abscess (unlabeled use): I.V.: 1 g every 8 hours for 2-3 weeks, then oral therapy for duration of 4-6 weeks

Meningitis (unlabeled use): 2 g every 8 hours

Mild-to-moderate infection, other severe infections (unlabeled use): 1.5-3 g/day divided every 8 hours

Skin and skin structure infections (complicated): I.V.: 500 mg every 8 hours; diabetic foot: 1 g every 8 hours

Urinary tract infections, complicated (unlabeled use): I.V.: 500 mg to 1 g every 8 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Febrile neutropenia (unlabeled use): I.V.:

Children ≥3 months (<50 kg): 20 mg/kg every 8 hours (maximum dose: 1 g every 8 hours)

Children >50 kg: Refer to adult dosing.

Intra-abdominal infections: I.V.:

Children ≥3 months (<50 kg): 20 mg/kg every 8 hours (maximum dose: 1 g every 8 hours)

Children >50 kg: 1 g every 8 hours

Meningitis: I.V.: Children ≥3 months (<50 kg): 40 mg/kg every 8 hours (maximum dose: 2 g every 8 hours)

Skin and skin structure infections (complicated): I.V.:

Children ≥3 months (<50 kg): 10 mg/kg every 8 hours (maximum dose: 500 mg every 8 hours)

Children >50 kg: Refer to adult dosing.

Dosing: Renal Impairment
Cl_{cr} 26-50 mL/minute: Administer recommended dose based on indication every 12 hours

Cl_{cr} 10-25 mL/minute: Administer one-half recommended dose based on indication every 12 hours

Cl_{cr} <10 mL/minute: Administer one-half recommended dose based on indication every 24 hours

Dialysis: Meropenem and its metabolites are readily dialyzable; administer dose after dialysis

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH or CVVHD/CVVHDF: 1 g every 12 hours to achieve target trough of ~ 4 mg/L; 500 mg every 12 hours may be considered for highly sensitive organisms. **Note:** Substantial variability exists in various published recommendations, ranging from 1-3 g/day given in 2-3 divided doses.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer I.V. infusion over 15-30 minutes; I.V. bolus injection over 3-5 minutes.
Administration: I.V. DetailpH: 7.3-8.3
Dietary Considerations1 g of meropenem contains 90.2 mg of sodium as sodium carbonate (3.92 mEq)
Storage Dry powder should be stored at controlled room temperature 20°C to 25°C (68°F to 77°F).
Injection reconstitution: Stability in vial when constituted (up to 50 mg/mL) with:

SWFI: Stable for up to 2 hours at controlled room temperature of 15°C to 25°C (59°F to 77°F) or for up to 12 hours under refrigeration.

Sodium chloride: Stable for up to 2 hours at controlled room temperature of 15°C to 25°C (59°F to 77°F) or for up to 18 hours under refrigeration.

Dextrose 5% injection: Stable for 1 hour at controlled room temperature of 15°C to 25°C (59°F to 77°F) or for 8 hours under refrigeration.

Infusion admixture (1-20 mg/mL): Solution stability when diluted in NS is 4 hours at controlled room temperature of 15°C to 25°C (59°F to 77°F) or 24 hours under refrigeration. Stability in D_5W is 1 hour at controlled room temperature of 15°C to 25°C (59°F to 77°F) or for 4 hours under refrigeration.

ReconstitutionMeropenem infusion vials may be reconstituted with SWFI or a compatible diluent (eg, NS). The 500 mg vials should be reconstituted with 10 mL, and 1 g vials with 20 mL. May be further diluted with compatible solutions for infusion. Consult detailed reference/product labeling for compatibility.
Compatibility**Compatible** in NS for 4 hours at controlled room temperature and up to 24 hours refrigerated. **Variable stability (consult detailed reference)** in D_5LR, $D_5{}^1/_4NS$, D_5NS, D_5W, $D_{10}W$, LR, $^1/_2NS$, mannitol 2.5%, mannitol 10%, sodium bicarbonate 5%.

Y-site administration: Compatible: Aminophylline, atenolol, atropine, cimetidine, dexamethasone sodium phosphate, digoxin, diphenhydramine, docetaxel, enalaprilat, fluconazole, furosemide, gentamicin, heparin, insulin (regular), linezolid, metoclopramide, milrinone, morphine, norepinephrine, phenobarbital, potassium chloride, vancomycin. **Incompatible:** Amphotericin B, diazepam, metronidazole. **Variable (consult detailed reference):** Acyclovir, calcium gluconate, doxycycline, ondansetron, zidovudine.

Compatibility in syringe: Incompatible with pantoprazole.

Compatibility when admixed: Compatible: Aminophylline, atropine, cimetidine, dexamethasone sodium phosphate, dobutamine, dopamine, enalaprilat, fluconazole, furosemide, gentamicin, heparin, insulin (regular), magnesium sulfate, metoclopramide, morphine, norepinephrine, phenobarbital, ranitidine, vancomycin. **Incompatible:** Amphotericin B, metronidazole, multivitamins. **Variable (consult detailed reference):** Acyclovir, doxycycline, ondansetron, zidovudine.

ContraindicationsHypersensitivity to meropenem, any component of the formulation, or other carbapenems (eg, imipenem); patients who have experienced anaphylactic reactions to other beta-lactams
Allergy Considerations

- Carbapenem Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Serious hypersensitivity reactions, including anaphylaxis, have been reported (some without a history of previous allergic reactions to beta-lactams).

- CNS effects: Has been associated with CNS adverse effects, including confusional states and seizures; use caution with CNS disorders (eg, brain lesions, history of seizures, or renal impairment).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required in patients with moderate-to-severe renal dysfunction. Increased seizure risk and thrombocytopenia have been reported in patients with renal dysfunction.

Special populations:

- Elderly: Lower doses (based upon renal function) are often required in the elderly.

Geriatric ConsiderationsAdjust dose based on renal function.
Pregnancy Risk FactorB
Pregnancy ConsiderationsMeropenem is classified as pregnancy category B because no evidence of impaired fertility or fetal harm has been found in animals. Adequate and well-controlled studies have not been conducted in pregnant women and it is not known whether meropenem can cause fetal harm.
LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if meropenem is excreted in breast milk. The manufacturer recommends that caution be exercised when administering meropenem to breast-feeding women. Most penicillins and carbapenems are safe for use in breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Meropenem in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Cardiovascular: Peripheral vascular disorder

Central nervous system: Headache (2% to 8%), pain (≤5%)

Dermatologic: Rash (2% to 3%, includes diaper-area moniliasis in pediatrics), pruritus (1%)

Endocrine & metabolic: Hypoglycemia

Gastrointestinal: Diarrhea (4% to 7%), nausea/vomiting (1% to 8%), constipation (1% to 7%), oral moniliasis (up to 2% in pediatric patients), glossitis (1%)

Hematologic: Anemia (≤6%)

Local: Inflammation at the injection site (2%), phlebitis/thrombophlebitis (1%), injection site reaction (1%)

Respiratory: Apnea (1%), pharyngitis, pneumonia

Miscellaneous: Sepsis (2%), shock (1%)

<1%: Abdominal enlargement, abdominal pain, agitation/delirium, alkaline phosphatase increased, ALT increased, AST increased, anemia (hypochromic), anorexia, anxiety, asthma, back pain, bilirubin increased, bradycardia, BUN increased, chest pain, chills, cholestatic jaundice/jaundice, confusion, cough, creatinine increased, depression, diaphoresis, dizziness, dyspepsia, dyspnea, dysuria, eosinophilia, epistaxis (0.2%), fever, flatulence, gastrointestinal hemorrhage (0.5%), hallucinations, heart failure, hemoglobin/hematocrit decreased, hemoperitoneum (0.2%), hepatic failure, hyper-/hypotension, hypervolemia, hypokalemia, hypoxia, ileus, insomnia, intestinal obstruction, LDH increased, leukocytosis, melena (0.3%), MI, nervousness, paresthesia, pelvic pain, peripheral edema, platelets decreased/increased, pleural effusion, prothrombin time decreased, pulmonary edema, pulmonary embolism, renal failure, respiratory disorder, seizure, skin ulcer, somnolence, syncope, tachycardia, urinary incontinence, urticaria, vaginal moniliasis, weakness, WBC decreased, whole body pain

Postmarketing and/or case reports: Agranulocytosis, angioedema, erythema multiforme, hemolytic anemia, leukopenia, neutropenia, positive Coombs test, Stevens-Johnson syndrome, toxic epidermal necrolysis

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Carbapenems. Management: Avoid concomitant use of doripenem and probenecid. *Risk C: Monitor therapy*

Valproic Acid: Carbapenems may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Monitoring ParametersPerform culture and sensitivity testing prior to initiating therapy. Monitor for signs of anaphylaxis during first dose. During prolonged therapy, monitor renal function, liver function, CBC.

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to beginning treatment. Use caution in presence of renal impairment or neurologic disorder. Infusion site should be monitored closely for phlebitis/thrombophlebitis. Assess renal and hepatic function and CBC, therapeutic effectiveness (resolution of infection), and adverse reactions. Teach patient proper use (according to formulation), possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity testing prior to initiating therapy. During prolonged therapy, monitor renal function, liver function, CBC.

Patient EducationThis medication can only be given by infusion. Report immediately any burning, pain, swelling, or redness at infusion site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (boiled milk, buttermilk, or yogurt may help); or headache. Report persistent GI distress, persistent diarrhea, mouth sores, respiratory difficulty, headache, or CNS changes (agitation, delirium). **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Merrem® I.V: 500 mg [contains sodium 45.1 mg as sodium carbonate (1.96 mEq)]; 1 g [contains sodium 90.2 mg as sodium carbonate (3.92 mEq)]

Generic AvailableNo

ManufacturerAstraZeneca Pharmaceuticals LP

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Merrem)

500 mg (1): $47.37

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to several of the penicillin-binding proteins, which in turn inhibit the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis; bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested

Pharmacodynamics/Kinetics

Distribution: V_d: Adults: ~0.3 L/kg, Children: 0.4-0.5 L/kg; penetrates well into most body fluids and tissues; CSF concentrations approximate those of the plasma

Protein binding: ~2%

Metabolism: Hepatic; metabolized to open beta-lactam form (inactive)

Half-life elimination:

Normal renal function: 1-1.5 hours

Cl_{cr} 30-80 mL/minute: 1.9-3.3 hours

Cl_{cr} 2-30 mL/minute: 3.82-5.7 hours

Time to peak, tissue: 1 hour following infusion

Excretion: Urine (~25% as inactive metabolites)

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Mesalamine may be confused with mecamylamine, methenamine

Apriso™ may be confused with Apri®

Asacol® may be confused with Ansaid®, Os-Cal®

Lialda™ may be confused with Aldara®

Pronunciation(me SAL a meen)

U.S. Brand NamesApriso™; Asacol®; Canasa®; Lialda™; Pentasa®; Rowasa®

Canadian Brand NamesAsacol®; Asacol® 800; Mesasal®; Mezavant®; Novo-5 ASA; Pendo-5 ASA; Pentasa®; Quintasa®; Rowasa®; Salofalk®

Pharmacologic Category5-Aminosalicylic Acid Derivative

Use: Labeled Indications

Oral: Treatment and maintenance of remission of mildly- to moderately-active ulcerative colitis

Rectal: Treatment of active mild-to-moderate distal ulcerative colitis, proctosigmoiditis, or proctitis

Dosing: Adults

Treatment of ulcerative colitis: Oral: Usual course of therapy is 3-8 weeks:

Capsule: 1 g 4 times/day

Tablet: Initial:

Asacol®: 800 mg 3 times/day for 6 weeks

Lialda™, Mezavant®: 2.4-4.8 g once daily for up to 8 weeks

Maintenance of remission of ulcerative colitis: Oral:

Capsule:

Apriso™: 1.5 g once daily in the morning

Pentasa®: 1 g 4 times/day

Tablet (Asacol®): 1.6 g/day in divided doses; **Note:** Lialda™ and Mezavant® tablets are approved for treatment only.

Distal ulcerative colitis, proctosigmoiditis, or proctitis: Rectal: Retention enema: 60 mL (4 g) at bedtime, retained overnight, approximately 8 hours

Active ulcerative proctitis: Rectal: Rectal suppository (Canasa®): Insert one 1000 mg suppository in rectum daily at bedtime

Note: Suppositories should be retained for at least 1-3 hours to achieve maximum benefit.

Note: Some patients may require rectal and oral therapy concurrently.

Dosing: ElderlyRefer to adult dosing.

Administration: OralSwallow capsules or tablets whole, do not chew or crush.

Apriso™: Administer with or without food; do not administer with antacids

Asacol®: Do not break outer coating.

Lialda™: Do not break outer coating; should be administered once daily with a meal

Mezavant®: Do not break outer coating; should be administered once daily with a meal

Administration: Other

Rectal enema: Shake bottle well. Retain enemas for 8 hours or as long as practical.

Suppository: Remove foil wrapper; avoid excessive handling. Should be retained for at least 1-3 hours to achieve maximum benefit.

Dietary Considerations

Apriso™: Take with or without food; do not administer with antacids. Contains 0.56 mg phenylalanine per capsule.

Canasa® rectal suppository contains saturated vegetable fatty acid esters.

Storage

Capsule:

Apriso™: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F)

Pentasa®: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

Enema: Store at controlled room temperature. Use promptly once foil wrap is removed. Contents may darken with time (do not use if dark brown).

Suppository: Store below 25°C (below 77°F). May store under refrigeration; do not freeze. Protect from direct heat, light, and humidity.

Tablet: Store at controlled room temperature:

Asacol®: 20°C to 25°C (68°F to 77°F)

Lialda™: 15°C to 30°C (59°F to 86°F)

Mezavant®: 15°C to 25°C (59°F to 77°F)

Contraindications

Hypersensitivity to mesalamine, aminosalicylates, salicylates, or any component of the formulation

Allergy Considerations

- 5-Aminosalicylic Acid Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Abdominal discomfort: Pancreatitis should be considered in patients with new abdominal discomfort.
- Cardiac effects: Pericarditis or myocarditis have been reported with use and should be considered in patients with chest pain. Use with caution in patients predisposed to these conditions.
- Colitis: Symptomatic worsening of colitis/IBD may occur following initiation of therapy.
- Intolerance syndrome: May cause an acute intolerance syndrome (cramping, acute abdominal pain, bloody diarrhea; sometimes fever, headache, rash); discontinue if this occurs.
- Oligospermia: In males, oligospermia (rare, reversible) has been reported.
- Sulfasalazine hypersensitivity: Patients with hypersensitivity to sulfasalazine may react to mesalamine; although usually well-tolerated in this population, use with caution.

Disease-related concerns:

- Hepatic impairment: Use caution in patients with hepatic dysfunction; hepatic failure has been reported.
- Peptic ulcer: Use with caution in patients with active peptic ulcers.
- Pyloric stenosis: Patients with pyloric stenosis may have prolonged gastric retention of tablets, delaying the release of mesalamine in the colon.
- Renal impairment: Use with caution in patients with renal impairment or a history of renal disease. Renal disease (including minimal change nephropathy, acute/chronic interstitial nephritis, nephrotic syndrome, and renal failure) has been reported; use caution with other medications converted to mesalamine. An evaluation of renal function is recommended prior to initiation of mesalamine products and periodically during treatment.

Special populations:

- Elderly: Use with caution in the elderly; postmarketing reports suggest an increased incidence of blood dyscrasias in patients >65 years of age. In addition, elderly may have difficulty administering and retaining rectal suppositories or may have decreased renal function.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Apriso™: Contains phenylalanine.
- Canasa® suppositories: Contain saturated vegetable fatty acid esters (contraindicated in patients with allergy to these components).
- Rowasa® enema: Contains potassium metabisulfite; may cause severe hypersensitivity reactions (ie, anaphylaxis) in patients with sulfite allergies.

Geriatric Considerations

Use with caution. Elderly may have difficulty administering and retaining rectal suppositories. Given renal function decline with aging, monitor serum creatinine often during therapy.

Pregnancy Risk Factor

B

Pregnancy ConsiderationsAnimal studies have not demonstrated teratogenicity or fertility impairment. There are no adequate and well-controlled studies in pregnant women. Mesalamine is known to cross the placenta.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsAdverse effects (diarrhea) in a nursing infant have been reported while the mother received rectal administration of mesalamine within 12 hours after the first dose. The AAP recommends to monitor the infant stool for consistency and to use with caution. Low concentrations of the parent drug and higher concentrations of the N-acetyl metabolite of the parent drug have been detected in human breast milk.

Adverse ReactionsAdverse effects vary depending upon dosage form. Incidence usually on lower end with enema and suppository dosage forms.

>10%:

Central nervous system: Headache (2% to 35%), pain (≤14%)

Gastrointestinal: Abdominal pain (1% to 18%), eructation (16%), nausea (3% to 13%)

Respiratory: Pharyngitis (11%)

1% to 10%:

Cardiovascular: Chest pain (3%), peripheral edema (3%)

Central nervous system: Dizziness (2% to 8%), fever (1% to 6%), chills (3%), malaise (2% to 3%), fatigue (<3%), vertigo (<3%), insomnia (2%)

Dermatologic: Rash (1% to 6%), pruritus (1% to 3%), alopecia (<3%), acne (1% to 2%)

Endocrine & metabolic: Triglyceride increased (<3%)

Gastrointestinal: Diarrhea (8%), dyspepsia (6%), flatulence (2% to 6%), constipation (5%), vomiting (1% to 5%), colitis exacerbation (1% to 3%), rectal bleeding (<3%), rectal pain (1% to 2%), hemorrhoids (1%)

Hematologic: Hematocrit/hemoglobin decreased (<3%)

Hepatic: Cholestatic hepatitis (<3%), transaminases increased (<3%), ALT increased (1%)

Local: Pain on insertion of enema tip (1%)

Neuromuscular & skeletal: Back pain (1% to 7%), arthralgia (≤5%), hypertonia (5%), myalgia (3%), arthritis (2%), leg/joint pain (2%)

Ocular: Conjunctivitis (2%)

Otic: Tinnitus (<3%)

Renal: Creatinine clearance decreased (<3%), hematuria (<3%)

Respiratory: Nasopharyngitis (4%), dyspnea (<3%), cough (2%)

Miscellaneous: Flu-like syndrome (3% to 5%), diaphoresis (3%), intolerance syndrome (3%)

Postmarketing and/or case reports: Abdominal distention, agranulocytosis, albuminuria, alkaline phosphatase increased, amenorrhea, anxiety, anemia, angioedema, anorexia, aplastic anemia, asthma exacerbation, bilirubin increased, bloody diarrhea, bronchitis, BUN increased, cholestatic jaundice, cholecystitis, cramping, depression, disorientation, drug fever, dysphagia, dysuria, ear pain, edema, emotional lability, eosinophilia, eosinophilic pneumonia, epididymitis, erythema nodosum, eye pain, facial edema, fecal incontinence, fibrosing alveolitis, gastritis, gastroenteritis, gastrointestinal bleeding, GGT increased, gout, granulocytopenia, Guillain-Barré syndrome, hepatic failure, hepatic necrosis, hepatitis, hepatocellular damage, hepatotoxicity, hyperesthesia, hypersensitivity pneumonitis, hyper-/hypotension, indigestion, infertility, interstitial nephritis, interstitial pneumonia, jaundice, Kawasaki-like syndrome, LDH increased, leukopenia, libido decreased, lichen planus, lupus-like syndrome, lymphadenopathy, menorrhagia, metrorrhagia, migraine, minimal change nephrotic syndrome, myocarditis, neck pain, nephropathy, nephrotoxicity, neutropenia, oligospermia, oral moniliases, oral ulcers, palpitation, pancreatitis, pancytopenia, paresthesia, perforated peptic ulcer, pericardial effusion, pericarditis, peripheral neuropathy, pharyngolaryngeal pain, photosensitivity, pleuritis, pneumonitis, prurigo, psoriasis, pyoderma gangrenosum, rectal polyp, renal failure, rheumatoid arthritis, rhinitis, serum creatinine increased, somnolence, stomatitis, stool abnormalities, systemic lupus erythematosus, tachycardia, taste perversion, tenesmus, thrombocythemia, thrombocytopenia, transverse myelitis, tremor, T-wave abnormalities, urinary frequency, urinary urgency, urticaria, vasodilation, vision abnormalities, weakness, xerostomia

Drug Interactions

Antacids: May diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids. *Risk X: Avoid combination*

Cardiac Glycosides: 5-ASA Derivatives may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

H2-Antagonists: May diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; H2-antagonists would be expected to interact in a similar manner. *Risk X: Avoid combination*

Proton Pump Inhibitors: May diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Thiopurine Analogs: 5-ASA Derivatives may decrease the metabolism of Thiopurine Analogs. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: 5-ASA Derivatives may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. The primary concern is the potential development of Reye's Syndrome, a condition that has been associated with the use of salicylates in children with varicella infections. *Risk D: Consider therapy modification*

Monitoring ParametersCBC and renal function, particularly in elderly patients

Nursing: Physical Assessment/MonitoringAssess history of allergy to salicylates prior to beginning treatment. Use caution in presence of impaired hepatic or renal function and in predisposition to pericarditis or myocarditis. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (chest pain, CNS effects, gastrointestinal upset, exacerbation of colitis) on a regular basis throughout therapy. Teach patient proper use (according to formulation), possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsCBC and renal function, particularly in elderly patients

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed. You may experience headache; gastrointestinal upset; back, joint, or muscle pain; flu-like syndrome; or cough. Report severe abdominal pain, unresolved diarrhea, jaundice, severe headache, any unusual pain (back, joint, muscle, swelling of extremities, or chest pain), other persistent adverse effects, or lack of improvement.

Oral: Do not chew or break tablets or capsules. Notify prescriber if whole or partial tablets are repeatedly found in stool; should be taken with a meal.

Enema: Shake well before using; retain for 8 hours or as long as possible. May cause staining of clothing and undergarments. Do not use if solution is dark brown.

Suppository: Store below 25° C (77° F). May store in refrigerator; do not freeze. After removing foil wrapper, insert high in rectum without excessive handling (warmth will melt suppository). Lubricating gel may be used if needed to assist insertion. Retain suppositories for at least 1-3 hours to achieve maximum benefit. May cause staining of clothing and undergarments.

Breast-feeding precaution: Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule, controlled release:

Pentasa®: 250 mg, 500 mg

Capsule, extended release:

Apriso™: 0.375 g [contains phenylalanine 0.56 mg/capsule]

Suppository, rectal:

Canasa®: 1000 mg [contains saturated vegetable fatty acid esters]

Suspension, rectal: 4 g/60 mL (7s, 28s) [contains potassium metabisulfite and sodium benzoate]

Rowasa®: 4 g/60 mL (7s, 28s) [contains potassium metabisulfite and sodium benzoate]

Tablet, delayed release [enteric coated]:

Asacol®: 400 mg

Lialda™: 1.2 g

Tablet, delayed and extended release:

Mezavant® [CAN]: 1.2 g [not available in U.S.]

Generic AvailableYes: Rectal suspension

Pricing: U.S. (www.drugstore.com)

Capsule, controlled release (Pentasa)

250 mg (240): $246.62

500 mg (30): $60.99

Enema (Mesalamine)

4 g (420): $90.01

Enema (Rowasa)

4 g (420): $180.01

Suppository (Canasa)

1000 mg (30): $446.36

Tablet, EC (Asacol)

400 mg (30): $53.49

Tablet, EC (Lialda)

1.2 g (120): $607.39

Mechanism of ActionMesalamine (5-aminosalicylic acid) is the active component of sulfasalazine; the specific mechanism of action of mesalamine is unknown; however, it is thought that it modulates local chemical mediators of the inflammatory response, especially leukotrienes, and is also postulated to be a free radical scavenger or an inhibitor of tumor necrosis factor (TNF); action appears topical rather than systemic

Pharmacodynamics/Kinetics

Absorption: Rectal: Variable and dependent upon retention time, underlying GI disease, and colonic pH; Oral: Tablet: ~21% to 28%, Capsule: ~20% to 40%

Distribution: ~18 L

Protein binding: 43%

Metabolism: Hepatic and via GI tract to N-acetyl-5-aminosalicylic acid

Half-life elimination: 5-ASA: 0.5-10 hours; N-acetyl-5-ASA: 2-15 hours

Time to peak, serum:

Capsule: Apriso™: ~4 hours; Pentasa®: 3 hours

Rectal: 4-7 hours

Tablet: Asacol®: 4-12 hours; Lialda™: 9-12 hours; Mezavant®: 8 hours

Excretion: Urine (primarily as metabolites, <8% as unchanged drug); feces (<2%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pharyngitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMalaise is common

Mental Health: Effects on Psychiatric TreatmentNone reported

Index Terms5-Aminosalicylic Acid; 5-ASA; Fisalamine; Mesalazine

Mesna

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(MES na)

U.S. Brand NamesMesnex®

Canadian Brand NamesMesnex®; Uromitexan

Pharmacologic CategoryAntidote; Uroprotectant

Use: Labeled IndicationsPreventative agent to reduce the incidence of ifosfamide-induced hemorrhagic cystitis

Use: Unlabeled/InvestigationalPreventative agent to reduce the incidence of cyclophosphamide-induced hemorrhagic cystitis with high-dose cyclophosphamide

Dosing: Adults **Note:** Details concerning dosing in combination regimens should also be consulted. Mesna dosing schedule should be repeated each day ifosfamide is received. If ifosfamide dose is adjusted, the mesna dose should also be modified to maintain the mesna-to-ifosfamide ratio.

Prevention of ifosfamide-induced hemorrhagic cystitis:

- I.V.:
    - Short infusion standard-dose ifosfamide (<2.5 g/m^2/day): Mesna dose is equal to 60% of the ifosfamide dose given in 3 divided doses (0, 4, and 8 hours after the start of ifosfamide)
    - Continuous infusion standard-dose ifosfamide (<2.5 g/m^2/day): ASCO guidelines: Mesna dose (as an I.V. bolus) is equal to 20% of the ifosfamide dose, followed by a continuous infusion of mesna at 40% of the ifosfamide dose, continue mesna infusion for 12-24 hours after completion of ifosfamide infusion (Hensley, 2008)
    - High-dose ifosfamide (>2.5 g/m^2/day): ASCO guidelines: Evidence for use is inadequate; more frequent and prolonged mesna administration regimens may be required.
- I.V. followed by oral (for ifosfamide doses ≤2 g/m^2/day): Mesna dose is equal to 100% of the ifosfamide dose, given as 20% of the ifosfamide dose I.V. at hour 0, followed by 40% of the ifosfamide dose given orally 2- and 6 hours after start of ifosfamide

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Dosing: Combination Regimens

Breast cancer: ICE-T

Cervical cancer: BIP

Esophageal cancer: TIP

Head and neck cancer: TIP

Leukemia, acute lymphocytic:

- Hyper-CVAD + Imatinib
- Hyper-CVAD (Leukemia, Acute Lymphocytic)

Lung cancer (small cell): VIP (Small Cell Lung Cancer)

Lymphoma, non-Hodgkin's:

MAID

Testicular cancer:

Paclitaxel-Ifosfamide-Cisplatin

VIP (Etoposide) (Testicular Cancer)

Administration: I.V.Administer by short (15-30 minutes) infusion or continuous infusion (maintain continuous infusion for 12-24 after completion of ifosfamide infusion) (Hensley, 2008)

Administration: I.V. DetailpH: 6.5-8.5

Administration: OralAdminister orally in tablet formulation or parenteral solution diluted in water, milk, juice, or carbonated beverages; patients who vomit within 2 hours after taking oral mesna should repeat the dose or receive I.V. mesna

StorageStore intact vials and tablets at room temperature of 20°C to 25°C (68°F to 77°F). Opened multidose vials may be stored and used for use to 8 days after opening. Solutions diluted for infusion are stable for at least 24 hours at room temperature. Solutions in plastic syringes are stable for 9 days under refrigeration, or at room or body temperature. Solutions of mesna and ifosfamide in lactated Ringer's are stable for 7 days in a PVC ambulatory infusion pump reservoir. Solutions of mesna (0.5-3.2 mg/mL) and cyclophosphamide (1.8-10.8 mg/mL) in D_5W are stable for 48 hours refrigerated or 6 hours at room temperature (Menard, 2003). Mesna injection is stable for at least 7 days when diluted 1:2 or 1:5 with grape- and orange-flavored syrups or 11:1 to 1:100 in carbonated beverages for oral administration.

ReconstitutionDilute in 50-1000 mL D_5W, NS, $D_5{}^1/_4NS$, $D_5{}^1/_3NS$, $D_5{}^1/_2NS$, or lactated Ringer's (the manufacturer recommends a final concentration of 20 mg/mL).

CompatibilityStable in $D_5{}^1/_4NS$, $D_5{}^1/_3NS$, $D_5{}^1/_2NS$, D_5W, LR, NS.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, cladribine, docetaxel, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gallium nitrate, gemcitabine, granisetron, linezolid, melphalan, methotrexate, micafungin, ondansetron, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, sargramostim, sodium bicarbonate, teniposide, thiotepa, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Compatibility in syringe: Compatible: Ifosfamide. **Incompatible:** Ifosfamide with epirubicin.

Compatibility when admixed: Compatible: Hydroxyzine HCl, ifosfamide. **Incompatible:** Carboplatin, cisplatin, ifosfamide with epirubicin. **Variable (consult detailed reference):** Cyclophosphamide.

ContraindicationsHypersensitivity to mesna or other thiol compounds, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Allergic reactions have been reported; symptoms ranged from mild hypersensitivity to systemic anaphylactic reactions. Patients with autoimmune disorders receiving cyclophosphamide and mesna may be at increased risk.

- Hematuria: Examine morning urine specimen for hematuria prior to ifosfamide or cyclophosphamide treatment; if hematuria (>50 RBC/HPF) develops, reduce the ifosfamide/cyclophosphamide dose or discontinue the drug; will not prevent hemorrhagic cystitis in all patients.

- Ifosfamide/cyclophosphamide toxicities: Will not prevent or alleviate toxicities associated with ifosfamide or cyclophosphamide, other than hemorrhagic cystitis.

Disease related concerns:

- Thrombocytopenia: Mesna will not reduce the risk of thrombocytopenia-related hematuria.

Dosage form specific issues:

- Benzyl alcohol: I.V. formulation contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Hydration: Patients should receive adequate hydration during treatment.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding Considerations

Due to the potential for adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

Mesna alone (frequency not defined):

Cardiovascular: Flushing

Central nervous system: Dizziness, fever, headache, hyperesthesia, somnolence

Dermatologic: Rash

Gastrointestinal: Anorexia, constipation, diarrhea, flatulence, nausea, taste alteration/bad taste (with oral administration), vomiting

Local: Injection site reactions

Neuromuscular: Arthralgia, back pain, rigors

Ocular: Conjunctivitis

Respiratory: Cough, pharyngitis, rhinitis

Miscellaneous: Flu-like syndrome

Mesna alone or in combination: Postmarketing and/or case reports: Allergic reaction, anaphylactic reaction, hypersensitivity, hyper-/hypotension, injection site erythema, injection site pain, limb pain, malaise, myalgia, platelets decreased, ST-segment increased, tachycardia, tachypnea, transaminases increased

Oncology: VesicantNo

Oncology: Emetic PotentialWhen administered orally, the unpleasant taste may result in vomiting.

Drug InteractionsThere are no known significant interactions.

Test InteractionsFalse-positive urinary ketones with Multistix® or Labstix®

Monitoring ParametersUrinalysis

Nursing: Physical Assessment/MonitoringMonitor laboratory results and assess frequently for hematuria/bladder hemorrhage.

Monitoring: Lab TestsUrinalysis

Patient EducationThis drug is given to help prevent side effects of other chemotherapeutic agents you are taking. Report blood in urine. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 100 mg/mL (10 mL) [contains benzyl alcohol]

Mesnex®: 100 mg/mL (10 mL) [contains benzyl alcohol]

Tablet:

Mesnex®: 400 mg

Generic AvailableYes: Solution for injection

Mechanism of ActionIn blood, mesna is oxidized to dimesna which in turn is reduced in the kidney back to mesna, supplying a free thiol group which binds to and inactivates acrolein, the urotoxic metabolite of ifosfamide and cyclophosphamide

Pharmacodynamics/Kinetics

Distribution: No tissue penetration

Protein binding: 69% to 75%

Metabolism: Rapidly oxidized intravascularly to mesna disulfide (dimesna); dimesna is reduced in renal tubules back to mesna following glomerular filtration

Bioavailability: Oral: 45% to 79%

Half-life elimination:

I.V.: Mesna: ~22 minutes; Dimesna: ~70 minutes

I.V. followed by oral: 1-8 hours

Time to peak, plasma: 2-3 hours

Excretion: Urine (18% to 32% as mesna; 33% as dimesna)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy Pearls**Oncology Comment:** Guidelines from the American Society of Clinical Oncology (ASCO) for the use of chemotherapy and radiotherapy protectants (Schuchter, 2002; Hensley, 2008 [update]) recommend mesna to decrease the incidence of ifosfamide-induced urotoxicity associated with short infusion and continuous infusion standard-dose ifosfamide (<2.5 g/m^2/day). Although evidence is inadequate regarding mesna's uroprotective effects in high-dose ifosfamide (>2.5 g/m^2/day), the guidelines suggest more frequent and prolonged mesna administration times may be required. For prevention high-dose cyclophosphamide-induced urotoxicity (associated with stem cell transplantation), the guidelines recommend mesna in conjunction with saline diuresis (or forced saline diuresis alone).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause malaise

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsMercaptoethane Sulfonate; Sodium 2-Mercaptoethane Sulfonate

Medication Safety Issues

Sound-alike/look-alike issues:

Metaproterenol may be confused with metipranolol, metoprolol

Alupent® may be confused with Atrovent®

Pronunciation(met a proe TER e nol)

U.S. Brand NamesAlupent® [DSC]

Canadian Brand NamesApo-Orciprenaline®; ratio-Orciprenaline®; Tanta-Orciprenaline®

Pharmacologic CategoryBeta$_2$ Agonist

Use: Labeled IndicationsBronchodilator in reversible airway obstruction due to asthma or COPD; because of its delayed onset of action (1 hour) and prolonged effect (4 or more hours), this may not be the drug of choice for assessing response to a bronchodilator

Dosing: Adults

Bronchoconstriction (Asthma, COPD):

Oral: 20 mg 3-4 times/day

Inhalation: 2-3 inhalations every 3-4 hours, up to 12 inhalations in 24 hours

Nebulizer: 5-20 breaths of full strength 5% metaproterenol **or** 0.2 to 0.3 mL 5% metaproterenol in 2.5-3 mL normal saline until nebulized every 4-6 hours (can be given more frequently according to need)

Dosing: ElderlyOral: Initial: 10 mg 3-4 times/day; increase as necessary up to 20 mg 3-4 times/day.

Dosing: Pediatric

Bronchoconstriction (asthma):

Oral:

<2 years: 0.4 mg/kg/dose given 3-4 times/day; in infants, the dose can be given every 8-12 hours

2-6 years: 1-2.6 mg/kg/day divided every 6 hours

6-9 years: 10 mg/dose 3-4 times/day

>9 years: 20 mg 3-4 times/day

Inhalation: >12 years: Refer to adult dosing.

Nebulizer:

Infants and Children: 0.01-0.02 mL/kg of 5% solution; minimum dose: 0.1 mL; maximum dose: 0.3 mL diluted in 2-3 mL normal saline every 4-6 hours (may be given more frequently according to need)

Adolescents: Refer to adult dosing.

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.

Administration: InhalationDo not use solutions for nebulization if they are brown or contain a precipitate. Shake inhaler well before using.

StorageStore in a tight, light-resistant container. Do not use if brown solution or contains a precipitate.

ContraindicationsHypersensitivity to metaproterenol or any component of the formulation; pre-existing cardiac arrhythmias associated with tachycardia

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.
- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

Disease-related concerns:

- Asthma: Appropriate use: Optimize anti-inflammatory treatment before initiating maintenance treatment with metaproterenol. Do not use as a component of chronic therapy without an anti-inflammatory agent. Only the mildest form of asthma (Step 1 and/or exercise-induced) would not require concurrent use based upon asthma guidelines.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia or hypertension or HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.

- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.

- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.

- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.

- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$-agonists may decrease serum potassium.

- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics: Face masks should be used in children <4 years of age.

Dosage form specific issues:

- Syrup/tablets: Oral use should be avoided due to the increased incidence of adverse effects.

Other warnings/precautions:

- Beta activity: Metaproterenol has more beta$_1$ activity than beta$_2$-selective agents such as albuterol and, therefore, may no longer be the beta-agonist of first choice.

- Patient information: Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of asthma, and treatment must not be delayed. All patients should utilize a spacer device when using a metered-dose inhaler.

Geriatric ConsiderationsElderly may find it useful to utilize a spacer device when using a metered dose inhaler. Oral use should be avoided due to the increased incidence of adverse effects.

Pregnancy Risk FactorC

Pregnancy ConsiderationsNo data on crossing the placenta. Reported association with polydactyly in 1 study; may be secondary to severe maternal disease or chance.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsNo data on crossing into breast milk or clinical effects on the infant.

Adverse Reactions

>10%:

Cardiovascular: Tachycardia (<17%)

Central nervous system: Nervousness (3% to 14%)

Endocrine & metabolic: Serum glucose increased, serum potassium decreased

Neuromuscular & skeletal: Tremor (1% to 33%)

1% to 10%:

Cardiovascular: Palpitation (<4%)

Central nervous system: Headache (<4%), dizziness (1% to 4%), insomnia (2%)

Gastrointestinal: Nausea, vomiting, bad taste, heartburn (≥4%), xerostomia

Neuromuscular & skeletal: Trembling, muscle cramps, weakness (1%)

Respiratory: Coughing, pharyngitis (≤4%)

Miscellaneous: Diaphoresis increased (≤4%)

<1%: Paradoxical bronchospasm, hypertension, hypokalemia, chest pain, angina, drowsiness, diarrhea, taste change

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Test InteractionsIncreased potassium (S)

Monitoring ParametersAssess lung sounds, heart rate, and blood pressure before administration and during peak of medication; observe patient for wheezing after administration, if this occurs, call physician; monitor respiratory rate, arterial or capillary blood gases if applicable; FEV$_1$, peak flow, and/or other pulmonary function tests; CNS stimulation; serum glucose, serum potassium

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy (relief of airway obstruction) and adverse reactions at beginning of therapy and periodically with long-term use. For inpatient care, vital signs and lung sounds should be monitored prior to and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFEV$_1$, peak flow, and/or other pulmonary function tests; serum potassium, serum glucose (in selected patients)

Patient EducationUse exactly as directed (see following administration information). Do not use more often than recommended. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nervousness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth, unpleasant aftertaste, stomach upset (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help); or increased perspiration. If you have diabetes, check blood sugar; blood glucose level may be increased. Report unresolved GI upset; dizziness or fatigue; vision changes; chest pain, rapid heartbeat, or palpitations; nervousness or insomnia; muscle cramping or tremor; or unusual cough. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Self-administered inhalation: Store canister upside down; do not freeze. Shake canister before using. Sit when using medication. Close eyes when administering metaproterenol to avoid spray getting into eyes. Exhale slowly and completely through nose; inhale deeply through mouth while administering aerosol. Hold breath for 5-10 seconds after inhalation. Wait at least 1 full minute between inhalations. Wash mouthpiece between use. If more than one inhalation medication is used, use bronchodilator first and wait 5 minutes between medications.

Self-administered nebulizer: Wash hands before and after treatment. Wash and dry nebulizer after each treatment. Twist open the top of one unit dose vial and squeeze contents into nebulizer reservoir. Connect nebulizer reservoir to the mouthpiece or face mask. Connect nebulizer to compressor. Sit in comfortable, upright position. Place mouthpiece in your mouth or put on face mask and turn on compressor. If face mask is used, avoid leakage around the mask to avoid mist getting into eyes which may cause vision problems. Breathe calmly and deeply until no more mist is formed in nebulizer (about 5 minutes). At this point treatment is finished.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol for oral inhalation, as sulfate:

Alupent®: 0.65 mg/inhalation (14 g) [contains chlorofluorocarbon; 200 doses] [DSC]

Solution for nebulization, as sulfate [preservative free]: 0.4% [4 mg/mL] (2.5 mL); 0.6% [6 mg/mL] (2.5 mL)

Syrup, as sulfate: 10 mg/5 mL (480 mL)

Tablet, as sulfate: 10 mg, 20 mg

Generic AvailableYes: Excludes inhaler

Pricing: U.S. (www.drugstore.com)

Aerosol powder (Alupent)

0.65 mg/ACT (14): $49.99

Mechanism of ActionRelaxes bronchial smooth muscle by action on beta$_2$-receptors with very little effect on heart rate

Pharmacodynamics/Kinetics

Onset of action: Bronchodilation: Oral: ~15 minutes; Inhalation: ~60 seconds

Peak effect: Oral: ~1 hour

Duration: ~1-5 hours

Related Information

- Bronchodilators
- Inhalant Agents

Pharmacotherapy PearlsUse with caution perioperatively due to beta$_1$ effect of agent. Hypertension and tachycardia are increased with exogenous sympathomimetics. During endotracheal intubation, beta$_2$-specific agent is more appropriate for perioperative use.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bad taste and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNervousness is common; may cause dizziness, restlessness, or insomnia

Mental Health: Effects on Psychiatric TreatmentConcurrent use with TCAs and MAO inhibitors may result in additive toxicity

Anesthesia and Critical Care Concerns/Other ConsiderationsHypertension and tachycardia are increased with exogenous sympathomimetics. Beta$_2$-specific agent is more appropriate for use.

Index TermsMetaproterenol Sulfate; Orciprenaline Sulfate

Medication Safety Issues

Sound-alike/look-alike issues:

Metaxalone may be confused with metolazone

Pronunciation(me TAKS a lone)
U.S. Brand NamesSkelaxin®
Canadian Brand NamesSkelaxin®
Pharmacologic CategorySkeletal Muscle Relaxant
Use: Labeled IndicationsRelief of discomfort associated with acute, painful musculoskeletal conditions
Dosing: Adults**Muscle discomfort:** Oral: 800 mg 3-4 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >12 years: Refer to adult dosing.
Administration: OralMay be administered with or without food. However, serum concentrations may be increased when administered with food; clinical significance has not been established. Patients should be monitored.
Dietary ConsiderationsAdministration with food may increase serum concentrations.
StorageStore at room temperature at 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to metaxalone or any component of the formulation; impaired hepatic or renal function, history of drug-induced hemolytic anemias or other anemias
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; routine monitoring of transaminases is recommended.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to CNS effects.
- Females: An increase in bioavailability and half-life have been observed in female patients.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, drowsiness, headache, irritability, paradoxical stimulation

Dermatologic: Rash (with or without pruritus)

Gastrointestinal: Gastrointestinal upset, nausea, vomiting

Hematologic: Hemolytic anemia, leukopenia

Hepatic: Jaundice

Miscellaneous: Hypersensitivity (including anaphylactoid reactions)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Bioavailability may be increased (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John’s wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsFalse-positive Benedict's test

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 400 mg [DSC], 800 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Skelaxin)

800 mg (30): $110.27

Mechanism of ActionPrecise mechanism has not been established; however, efficacy appears to result from disruption of the spasm-pain-spasm cycle, probably by a general CNS depressant effect. Does not have a direct effect on skeletal muscle.

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Duration: ~4-6 hours

Metabolism: Hepatic

Bioavailability: Not established; food may increase

Half-life elimination: 9 hours

Time to peak: T_{max}: 3 hours

Excretion: Urine (as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause paradoxical stimulation

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

MetFORMIN may be confused with metroNIDAZOLE

Glucophage® may be confused with Glucotrol®, Glutofac®

Pronunciation(met FOR min)

U.S. Brand NamesFortamet®; Glucophage®; Glucophage® XR; Glumetza™; Riomet®

Canadian Brand NamesApo-Metformin®; CO-Metformin; DOM-Metformin; Gen-Metformin; Glucophage®; Glumetza™; Glycon; MED-Metformin; Novo-Metformin; Nu-Metformin; PHL-Metformin; PMS-Metformin; RAN™-Metformin; RATIO-Metformin; RHOXAL-Metformin; RIVA-Metformin; Sandoz-Metformin FC

Pharmacologic CategoryAntidiabetic Agent, Biguanide

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as monotherapy when hyperglycemia cannot be managed with diet and exercise alone. In adults, may be used concomitantly with a sulfonylurea or insulin to improve glycemic control.

Use: Unlabeled/InvestigationalGestational diabetes mellitus (GDM); polycystic ovary syndrome (PCOS)

Dosing: Adults**Management of type 2 diabetes mellitus:** Oral: **Note:** Allow 1-2 weeks between dose titrations: Generally, clinically significant responses are not seen at doses <1500 mg daily; however, a lower recommended starting dose and gradual increased dosage is recommended to minimize gastrointestinal symptoms.

Immediate release tablet or solution: Adults ≥17 years: Initial: 500 mg twice daily **or** 850 mg once daily; increase dosage incrementally.

Incremental dosing recommendations based on dosage form:

500 mg tablet: One tablet/day at weekly intervals

850 mg tablet: One tablet/day every other week

Oral solution: 500 mg twice daily every other week

Doses of up to 2000 mg/day may be given twice daily. If a dose >2000 mg/day is required, it may be better tolerated in three divided doses. Maximum recommended dose 2550 mg/day.

*Extended release tablet:***Note:** If glycemic control is not achieved at maximum dose, may divide dose and administer twice daily.

Fortamet®: Initial: 1000 mg once daily; dosage may be increased by 500 mg weekly; maximum dose: 2500 mg once daily

Glucophage® XR: Initial: 500 mg once daily; dosage may be increased by 500 mg weekly; maximum dose: 2000 mg once daily

Glumetza™: Initial: 1000 mg once daily; dosage may be increased by 500 mg weekly; maximum dose: 2000 mg once daily

Transfer from other antidiabetic agents: No transition period is generally necessary except when transferring from chlorpropamide. When transferring from chlorpropamide, care should be exercised during the first 2 weeks because of the prolonged retention of chlorpropamide in the body, leading to overlapping drug effects and possible hypoglycemia.

Concomitant metformin and oral sulfonylurea therapy: If patients have not responded to 4 weeks of the maximum dose of metformin monotherapy, consider a gradual addition of an oral sulfonylurea, even if prior primary or secondary failure to a sulfonylurea has occurred. Continue metformin at the maximum dose. If adequate response has not occurred following 3 months of metformin and sulfonylurea combination therapy, consider switching to insulin with or without metformin.

Failed sulfonylurea therapy: Patients with prior failure on glyburide may be treated by gradual addition of metformin. Initiate with glyburide 20 mg and metformin 500 mg daily. Metformin dosage may be increased by 500 mg/day at weekly intervals, up to a maximum metformin dose (dosage of glyburide maintained at 20 mg/day).

Concomitant metformin and insulin therapy: Initial: 500 mg metformin once daily, continue current insulin dose; increase by 500 mg metformin weekly until adequate glycemic control is achieved

Maximum daily dose: Immediate release and solution: 2550 mg metformin; Extended release: 2000-2500 mg (varies by product)

Decrease insulin dose 10% to 25% when FPG <120 mg/dL; monitor and make further adjustments as needed

Dosing: ElderlyThe initial and maintenance dosing should be conservative, due to the potential for decreased renal function. Generally, elderly patients should **not** be titrated to the maximum dose of metformin. Do not use in patients ≥80 years of age unless normal renal function has been established. See Geriatric Considerations.

Dosing: Pediatric **Management of type 2 diabetes mellitus:** Oral: **Note:** Allow 1-2 weeks between dose titrations: Generally, clinically significant responses are not seen at doses <1500 mg daily; however, a lower recommended starting dose and gradual increased dosage is recommended to minimize gastrointestinal symptoms.

Immediate release tablet or solution:

Children 10-16 years: Initial: 500 mg twice daily; increases in daily dosage should be made in increments of 500 mg at weekly intervals, given in divided doses, up to a maximum of 2000 mg/day

Children ≥17 years: Refer to adult dosing.

Extended release tablet: Children ≥17 years: **Note:** If glycemic control is not achieved at maximum dose, may divide dose and administer twice daily.

Fortamet®: Initial: 1000 mg once daily; dosage may be increased by 500mg weekly; maximum dose: 2500 mg once daily

Glucophage® XR: Initial: 500 mg once daily; dosage may be increased by 500 mg weekly; maximum dose: 2000 mg once daily

Dosing: Renal Impairment The plasma and blood half-life of metformin is prolonged and the renal clearance is decreased in proportion to the decrease in creatinine clearance. Per the manufacturer, metformin is contraindicated in the presence of renal dysfunction defined as a serum creatinine >1.5 mg/dL in males, or >1.4 mg/dL in females and in patients with abnormal clearance. Clinically, it has been recommended that metformin be avoided in patients with Cl_{cr} <60-70 mL/minute (DeFronzo, 1999).

Dosing: Hepatic Impairment Avoid metformin; liver disease is a risk factor for the development of lactic acidosis during metformin therapy.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: Oral Extended release dosage form should be swallowed whole; do not crush, break, or chew; administer with food (to decrease GI upset). Administer Fortamet® with a glass of water.

Dietary Considerations Drug may cause GI upset; take with food (to decrease GI upset). Take at the same time each day. Dietary modification based on ADA recommendations is a part of therapy. Monitor for signs and symptoms of vitamin B_{12} and/or folic acid deficiency; supplementation may be required.

Storage

Oral solution: Store at 15°C to 30°C (59°F to 86°F).

Tablets: Store at 20°C to 25°C (68°F to 77°F); excursion permitted to 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

Contraindications Hypersensitivity to metformin or any component of the formulation; renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females) or abnormal creatinine clearance from any cause, including shock, acute myocardial infarction, or septicemia; acute or chronic metabolic acidosis with or without coma (including diabetic ketoacidosis)

Note: Temporarily discontinue in patients undergoing radiologic studies in which intravascular iodinated contrast media are utilized.

Allergy Considerations

- Biguanide Allergy

Warnings/Precautions

Boxed warnings:

- Lactic acidosis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Cardiovascular mortality: Administration of oral antidiabetic drugs has been reported to be associated with increased cardiovascular mortality; metformin does not appear to share this risk.
- Lactic acidosis: **[U.S. Boxed Warning]: Lactic acidosis is a rare, but potentially severe consequence of therapy with metformin.** Lactic acidosis should be suspected in any patient with diabetes receiving metformin with evidence of acidosis but without evidence of ketoacidosis. Discontinue metformin in clinical situations predisposing to hypoxemia, including conditions such as cardiovascular collapse, respiratory failure, acute myocardial infarction, acute congestive heart failure, and septicemia. The risk of accumulation and lactic acidosis increases with the degree of impairment of renal function.

Disease-related concerns:

- Heart failure: Use caution in patients with congestive heart failure requiring pharmacologic management, particularly in patients with unstable or acute heart failure; risk of lactic acidosis may be increased secondary to hypoperfusion.
- Hepatic impairment: Avoid use in patients with impaired liver function due to potential for lactic acidosis.
- Renal impairment: Metformin is substantially excreted by the kidney; patients with renal function below the limit of normal for their age should not receive therapy. Use of concomitant medications that may affect renal function (ie, affect tubular secretion) may also affect metformin disposition. Metformin should be withheld in patients with dehydration and/or prerenal azotemia.
- Stress-related states: It may be necessary to discontinue metformin and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Elderly: Metformin should not be initiated in patients ≥80 years of age unless normal renal function is confirmed.
- Pediatrics: Safety and efficacy have not been established in children <10 years of age. In addition, safety and efficacy for the extended release preparation have not been established in children <17 years of age.

Dosage form specific issues:

- Extended release tablet: Insoluble tablet shell (Glumetza™ 1000 mg tablet) may remain intact and be visible in the stool. Other extended released tablets (Fortamet®, Glucophage® XR, Glumetza™ 500 mg) may appear in the stool as a soft mass resembling the tablet.

Other warnings/precautions:

- Ethanol use: Instruct patients to avoid excessive acute or chronic ethanol use; ethanol may potentiate metformin's effect on lactate metabolism.
- Iodinated contrast: Therapy should be temporarily discontinued prior to or at the time of intravascular administration of iodinated contrast media (potential for acute alteration in renal function). Metformin should be withheld for 48 hours after the radiologic study and restarted only after renal function has been confirmed as normal.
- Surgical procedures: Therapy should be suspended for any surgical procedures (resume only after normal intake resumed and normal renal function is verified).

Geriatric ConsiderationsLimited data suggest that metformin's total body clearance may be decreased and AUC and half-life increased in elderly patients; presumably due to decreased renal clearance. Metformin has been well tolerated by the elderly but lower doses and frequent monitoring are recommended. In one study of elderly subjects, its effects could not be distinguished from tolbutamide, except for weight loss. The initial and maintenance dosing should be conservative, due to the potential for decreased renal function. Generally, elderly patients should not be titrated to the maximum dose of metformin. Do not use in patients ≥80 years of age unless normal renal function has been established. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, metformin is classified as pregnancy category B. Metformin has been found to cross the placenta in levels which may be comparable to those found in the maternal plasma. Pharmacokinetic studies suggest that clearance of metformin may be increased during pregnancy and dosing may need adjusted in some women when used during the third trimester.

Fetal, neonatal, and maternal outcomes have been evaluated following maternal use of metformin for the treatment of GDM and type 2 diabetes. Available information suggests that metformin use during pregnancy may be safe as long as good glycemic control is maintained; however, many studies used metformin during the second or third trimester only. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

Metformin has also been evaluated for the treatment of PCOS, a syndrome which may exhibit oligomenorrhea and in some women, hyperinsulinemia. When used to treat infertility related to PCOS, current guidelines restrict the use of metformin to women with glucose intolerance.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsLow amounts of metformin (generally ≤1% of the weight-adjusted maternal dose) are excreted into breast milk. Breast-feeding is not recommended by the manufacturer. Because breast milk levels of metformin stay relatively constant, avoiding nursing around peak plasma concentrations in the mother would not be helpful in reducing metformin exposure to the infant. Growth and development were not found to be affected in infants born to mothers with PCOS and who took metformin while breast-feeding.

Pregnancy & Lactation, In-Depth

- MetFORMIN in Pregnancy & Lactation

Adverse Reactions

>10%:

Gastrointestinal: Diarrhea (10% to 53%), nausea/vomiting (7% to 26%), flatulence (12%)

Neuromuscular & skeletal: Weakness (9%)

1% to 10%:

Cardiovascular: Chest discomfort, flushing, palpitation

Central nervous system: Headache (6%), chills, dizziness, lightheadedness

Dermatologic: Rash

Endocrine & metabolic: Hypoglycemia

Gastrointestinal: Indigestion (7%), abdominal discomfort (6%), abdominal distention, abnormal stools, constipation, dyspepsia/heartburn, taste disorder

Neuromuscular & skeletal: Myalgia

Respiratory: Dyspnea, upper respiratory tract infection

Miscellaneous: Diaphoresis increased, vitamin B_{12} levels decreased (7%), flu-like syndrome, nail disorder

<1%: Megaloblastic anemia

Postmarketing and/or case reports: Lactic acidosis, leukocytoclastic vasculitis, pneumonitis

Drug Interactions

Cephalexin: May increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Cimetidine: May decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Iodinated Contrast Agents: May enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (incidence of lactic acidosis may be increased; may cause hypoglycemia).

Food: Food decreases the extent and slightly delays the absorption. May decrease absorption of vitamin B_{12} and/or folic acid.

Herb/Nutraceutical: Caution with chromium, garlic, gymnema (may cause hypoglycemia).

Monitoring Parameters

Urine for glucose and ketones, fasting blood glucose, and hemoglobin A_{1c}. Initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit and red blood cell indices) and renal function should be performed, at least annually. Check vitamin B_{12} and folate if anemia is present.

Reference Range

Recommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/Monitoring

Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, anything that may effect glucose levels). Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, assess for signs and symptoms of vitamin B_{12} and/or folic acid deficiency; supplementation may be required) during therapy. Teach patient (or refer patient to diabetic educator for instruction) in appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab Tests

Urine for glucose and ketones, fasting blood glucose, hemoglobin A_{1c}, and fructosamine. Initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit and red blood cell indices) and renal function should be performed, at least annually. While megaloblastic anemia has been rarely seen with metformin, if suspected, vitamin B_{12} deficiency should be excluded.

Patient Education

Do not take any new medication during therapy unless approved by prescriber. Take as directed (may take with food to decrease GI upset). Do not chew or crush tablets. Parts of extended-release tablets may be excreted in the stool (normal). Do not change dosage or discontinue without consulting prescriber. Avoid overuse of alcohol (could cause severe reaction). It is important to follow dietary and lifestyle recommendations of prescriber. You will be instructed in signs of hypo- or hyperglycemia by prescriber or diabetic educator. May cause drowsiness or dizziness (use caution driving or engaging in potentially hazardous tasks until response to drug is known); nausea or vomiting (taking with meals, eating small frequent meals, frequent mouth care, or sucking lozenges may help); or abdominal distention, flatulence, diarrhea, constipation, or heartburn (if these persist consult prescriber for approved medication). Report immediately unusual weakness or fatigue; unusual muscle pain; persistent GI discomfort; dizziness or lightheadedness; unusual somnolence; sudden respiratory difficulty, chest discomfort, slow or irregular heartbeat; or other adverse reactions. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral, as hydrochloride:

Riomet®: 100 mg/mL (118 mL, 473 mL) [contains saccharin; cherry flavor]

Tablet, as hydrochloride: 500 mg, 850 mg, 1000 mg

Glucophage®: 500 mg, 850 mg, 1000 mg

Tablet, extended release, as hydrochloride: 500 mg, 750 mg

Fortamet®: 500 mg, 1000 mg

Glucophage® XR: 500 mg

Glumetza™: 500 mg, 1000 mg

Generic AvailableYes: Excludes solution
ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)
Pricing: U.S. (www.drugstore.com)

Solution (Riomet)

500 mg/5 mL (473): $87.98

Tablet, 24-hour (Fortamet)

500 mg (60): $118.22

1000 mg (60): $262.79

Tablet, 24-hour (Glucophage XR)

500 mg (60): $69.99

750 mg (30): $53.99

Tablet, 24-hour (Glumetza)

500 mg (100): $153.71

Tablet, 24-hour (Metformin HCl)

500 mg (90): $18.99

Tablets (Glucophage)

500 mg (60): $69.99

850 mg (60): $113.29

1000 mg (60): $141.08

Mechanism of ActionDecreases hepatic glucose production, decreasing intestinal absorption of glucose and improves insulin sensitivity (increases peripheral glucose uptake and utilization)
Pharmacodynamics/Kinetics

Onset of action: Within days; maximum effects up to 2 weeks

Distribution: V_d: 654 ± 358 L; partitions into erythrocytes

Protein binding: Negligible

Metabolism: Not metabolized by the liver

Bioavailability: Absolute: Fasting: 50% to 60%

Half-life elimination: Plasma: 4-9 hours

Time to peak, serum: Immediate release: 2-3 hours; Extended release: 7 hours (range: 4-8 hours)

Excretion: Urine (90% as unchanged drug; active secretion)

Related Information

- Diabetes Mellitus Management, Adults

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste disorder.

Metformin-dependent patients with diabetes (noninsulin dependent, Type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

Cardiovascular ConsiderationsMetformin, alone or in combination with other agents (sulfonylurea), is effective in the management of diabetes. Lactic acidosis is an uncommon side effect in patients without renal or respiratory insufficiency, hepatic failure, or conditions that predispose to hypoxemia. As heart failure may affect renal and pulmonary function, metformin should be avoided or used with caution in patients with diabetes and heart failure.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: While megaloblastic anemia has been rarely seen with metformin, if suspected, vitamin B_{12} deficiency should be excluded. Metformin has a large volume of distribution in liver, kidney, and GI tract where concentration is much larger than in the plasma.

Lactic acidosis is an uncommon side effect in patients without renal or respiratory insufficiency, hepatic failure, or conditions that predispose to hypoxemia.

Index TermsMetformin Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(meth a KOLE leen)

U.S. Brand NamesProvocholine®

Canadian Brand NamesMethacholine Omega; Provocholine®

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsDiagnosis of bronchial airway hyperactivity

Dosing: Adults**Note:** For inhalation only.

Challenge test: Before inhalation challenge, perform baseline pulmonary function tests; the patient must have an FEV_1 of at least 70% of the predicted value. The following is a suggested schedule for administration of methacholine challenge. Calculate cumulative units by multiplying number of breaths by concentration given. Total cumulative units is the sum of cumulative units for each concentration given. See following breakdown:

Methacholine

Vial	Serial Concentration (mg/mL)	No. of Breaths	Cumulative Units per Concentration	Total Cumulative Units
E	0.025	5	0.125	0.125
D	0.25	5	1.25	1.375
C	2.5	5	12.5	13.88
B	10	5	50	63.88
A	25	5	125	188.88

Determine FEV_1 within 5 minutes of challenge, a positive challenge is a 20% reduction in FEV_1

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Children ≥5 years: Refer to adult dosing.

Administration: InhalationAdminister by inhalation only; oral and injection administration has been associated with nausea, vomiting, substernal pain/pressure, hypotension, fainting, transient complete heartblock, and cardiac arrest.

StorageStore unreconstituted powder at 15°C to 30°C (59°F to 86°F). Store dilutions (A-D, serial concentrations 0.25-25 mg/mL) in refrigerator 2°C to 8°C (36°F to 46°F) for up to 2 weeks. Dilution E (serial concentration 0.025 mg/mL) must be prepared day of test.

ReconstitutionAll dilutions should be made with 0.9% sodium chloride or 0.9% sodium chloride containing 0.4% phenol. Use same diluent to prepare all concentrations. After dilution, shake well until solution is clear.

ContraindicationsHypersensitivity to methacholine, other parasympathomimetic agents, or any component of the formulation; concomitant use of beta-blockers; repeat administration (other than day of challenge test with increasing doses)

Warnings/Precautions

Boxed warnings:

- Appropriate use: See “Other warnings/precautions” below.
- Bronchoconstriction: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Bronchoconstriction: **[U.S. Boxed Warning]: Administer only by inhalation; severe bronchoconstriction and reduction in respiratory function can result.** Patients with severe hyper-reactivity of the airways can experience bronchoconstriction at a dosage as low as 0.025 mg/mL (0.125 cumulative units). If severe bronchoconstriction occurs, reverse immediately by administration of a rapid-acting inhaled bronchodilator (eg, albuterol).

Disease-related concerns:

- Risk to benefit: Use only in patients with cardiovascular disease, peptic ulcer disease, seizures, thyroid disease, urinary tract obstruction, and vagotonia if benefit outweighs risk.

Special populations:

- Females of childbearing potential: Administration should be within 10 days of the onset of menses or within 2 weeks of a negative pregnancy test.

- Pediatrics: Safety and efficacy have not been established in children <5 years of age.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Methacholine is a bronchoconstrictor for diagnostic purposes only.** Perform inhalation challenge under the supervision of a physician trained in and thoroughly familiar with all aspects of the technique, all contraindications, warnings, and precautions of methacholine challenge and the management of respiratory distress. Have emergency equipment and medication immediately available to treat acute respiratory distress. Product should not be handled by persons with asthma or hay fever.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Avoid use in pregnant women unless the potential benefit justifies the potential risk to the fetus. Administration should be within 10 days of the onset of menses or within 2 weeks of a negative pregnancy test.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Central nervous system: Headache, lightheadedness

Dermatologic: Itching

Gastrointestinal: Throat irritation

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Beta-Blockers: May enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for reconstitution, for oral inhalation, as chloride:

Provocholine®: 100 mg

Generic AvailableNo

Manufacturer

Methapharm Inc

Mechanism of ActionMethacholine chloride is a cholinergic (parasympathomimetic) synthetic analogue of acetylcholine. The drug stimulates muscarinic, postganglionic parasympathetic receptors, which results in smooth muscle contraction of the airways and increased tracheobronchial secretions.

Pharmacodynamics/Kinetics

Onset of action: Rapid

Peak effect: 1-4 minutes

Duration: 15-75 minutes or 5 minutes if methacholine challenge is followed with a beta-agonist agent

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause lightheadedness

Mental Health: Effects on Psychiatric TreatmentContraindicated with beta-blockers

Index TermsMethacholine Chloride

International Brand NamesProvocholine (IL); Provokit (DE)

Special Alerts

Methadone: Recommendations for QT_c Interval Screening Before and During Methadone Treatment - Updated: January 2009

The Center for Substance Abuse and Treatment (CSAT) of the Substance Abuse and Mental Health Services Administration has developed a consensus guideline statement outlining recommendations regarding ECG monitoring in patients being considered for and being treated with methadone regardless of indication. Of note, these recommendations should not supersede clinical judgment or patient preferences and may not apply to patients with terminal, intractable cancer pain.

Five recommendations have been developed:

Recommendation 1 [Disclosure]: Clinicians should inform patients of arrhythmia risk when methadone is prescribed.

Recommendation 2 [Clinical History]: Clinicians should inquire about any history of structural heart disease, arrhythmia, and syncope.

Recommendation 3 [Screening]: Clinicians should obtain pretreatment ECG for all patients to measure QTc interval, follow up ECG within 30 days, then annually (monitor more frequently if patient receiving >100 mg/day or if unexplained syncope or seizure occurs while on methadone).

Recommendation 4 [Risk Stratification]: If before or at anytime during therapy:

QT_c >450-499 msecs: Discuss potential risks and benefits; monitor QT_c more frequently

QT_c ≥500 msecs: Consider discontinuation or reducing methadone dose or eliminate factors promoting QT_c prolongation (eg, potassium-wasting drugs) or use alternative therapy (eg, buprenorphine)

Recommendation 5 [Drug Interactions]: Clinicians should be aware of interactions between methadone and other drugs that either prolong the QT interval or reduce methadone elimination.

The panel also concluded that the arrhythmia risk is directly associated with methadone's ability to block the delayed rectifier potassium channel (Ikr) and prolong repolarization. The guideline further states that the use of the Bazett formula is adequate even though it is likely to overcorrect with high heart rates. The patient should remain supine for at least 5 minutes prior to obtaining ECG. In addition, screening for QT_c prolongation using automated readings does not require a specialist (eg, cardiologist) and may be performed in a primary care setting. However, in cases when uncertainty exists about whether or not clinically significant QT_c prolongation is present, the ECG should be repeated or interpreted by a cardiologist.

For more information, refer to: Krantz MJ, Martin J, Stimmel B, et al, “QT_c Interval Screening in Methadone Treatment,” *Ann Int Med*, 2009, 150(1):1-10 (epub ahead of print).

Medication Safety Issues

Sound-alike/look-alike issues:

Methadone may be confused with dexmethylphenidate, Mephyton®, methylphenidate, Metadate® CD, and Metadate® ER

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(METH a done)

U.S. Brand NamesDolophine®; Methadone Diskets®; Methadone Intensol™; Methadose®

Canadian Brand NamesMetadol™

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsManagement of moderate-to-severe pain; detoxification and maintenance treatment of opioid addiction (if used for detoxification and maintenance treatment of narcotic addiction, it must be part of an FDA-approved program)

Dosing: AdultsRegulations regarding methadone use may vary by state and/or country. Obtain advice from appropriate regulatory agencies and/or consult with pain management/palliative care specialists. **Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Methadone accumulates with repeated doses and dosage may need reduction after 3-5 days to prevent CNS depressant effects. Some patients may benefit from every 8-12 hour dosing interval for chronic pain management. Doses should be titrated to appropriate effects.

Acute pain (moderate-to-severe):

Opioid-naive: *Oral:* Initial: 2.5-10 mg every 8-12 hours; more frequent administration may be required during initiation to maintain adequate analgesia. Dosage interval may range from 4-12 hours, since duration of analgesia is relatively short during the first days of therapy, but increases substantially with continued administration.

Chronic pain (opioid-tolerant): Conversion from oral morphine to oral methadone:

Daily oral morphine dose <100 mg: Estimated daily oral methadone dose: 20% to 30% of total daily morphine dose

Daily oral morphine dose 100-300 mg: Estimated daily oral methadone dose: 10% to 20% of total daily morphine dose

Daily oral morphine dose 300-600 mg: Estimated daily oral methadone dose: 8% to 12% of total daily morphine dose

Daily oral morphine dose 600-1000 mg: Estimated daily oral methadone dose: 5% to 10% of total daily morphine dose.

Daily oral morphine dose >1000 mg: Estimated daily oral methadone dose: <5% of total daily morphine dose.

Note: The total daily methadone dose should then be divided to reflect the intended dosing schedule.

I.V.: Manufacturers labeling: Initial: 2.5-10 mg every 8-12 hours in opioid-naive patients; titrate slowly to effect; may also be administered by SubQ or I.M. injection

Conversion from oral to parenteral dose: Initial dose: Parenteral:Oral ratio: 1:2 (eg, 5 mg parenteral methadone equals 10 mg oral methadone)

Detoxification:*Oral:*

Initial: A single dose of 20-30 mg is usually sufficient to suppress symptoms. Should not exceed 30 mg; lower doses should be considered in patients with low tolerance at initiation (eg, absence of opioids ≥5 days); an additional 5-10 mg of methadone may be provided if withdrawal symptoms have not been suppressed or if symptoms reappear after 2-4 hours; total daily dose on the first day should not exceed 40 mg, unless the program physician documents in the patient's record that 40 mg did not control opiate abstinence symptoms.

Maintenance: Titrate to a dosage which prevents craving, attenuates euphoric effect of self-administered opiates, and tolerance to sedative effects of methadone. Usual range: 80-120 mg/day (titration should occur cautiously)

Withdrawal: Dose reductions should be <10% of the maintenance dose, every 10-14 days

Detoxification (short-term):*Oral:*

Initial: Titrate to ~40 mg/day in divided doses to achieve stabilization. May continue 40 mg dose for 2-3 days

Maintenance: Titrate to a dosage which prevents/attenuates euphoric effects of self-administered opioids, reduces drug craving, and withdrawal symptoms are prevented for 24 hours.

Withdrawal: Requires individualization. Decrease daily or every other day, keeping withdrawal symptoms tolerable; hospitalized patients may tolerate a 20% reduction/day; ambulatory patients may require a slower reduction

Dosage adjustment during pregnancy: Methadone dose may need to be increased, or the dosing interval decreased; see Pregnancy Implications - use should be reserved for cases where the benefits clearly outweigh the risks

Dosing: ElderlyOral, I.M.: 2.5 mg every 8-12 hours; refer to adult dosing.

Dosing: PediatricRegulations regarding methadone use may vary by state and/or country. Obtain advice from appropriate regulatory agencies and/or consult with pain management/palliative care specialists. **Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Methadone accumulates with repeated doses and dosage may need reduction after 3-5 days to prevent CNS depressant effects. Some patients may benefit from every 8-12 hour dosing interval for chronic pain management. Doses should be titrated to appropriate effects.

Pain (analgesia) (unlabeled use):

Oral: Initial: 0.1-0.2 mg/kg 4-8 hours initially for 2-3 doses, then every 6-12 hours as needed. Dosing interval may range from 4-12 hours during initial therapy; decrease in dose or frequency may be required (~ days 2-5) due to accumulation with repeated doses (maximum dose: 5-10 mg)

I.V. (unlabeled use): 0.1 mg/kg every 4-8 hours initially for 2-3 doses, then every 6-12 hours as needed. Dosing interval may range from 4-12 hours during initial therapy; decrease in dose or frequency may be required (~ days 2-5) due to accumulation with repeated doses (maximum dose: 5-8 mg)

Iatrogenic narcotic dependency (unlabeled use): Oral: General guidelines: Initial: 0.05-0.1 mg/kg/dose every 6 hours; increase by 0.05 mg/kg/dose until withdrawal symptoms are controlled; after 24-48 hours, the dosing interval can be lengthened to every 12-24 hours; to taper dose, wean by 0.05 mg/kg/day; if withdrawal symptoms recur, taper at a slower rate

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Administer 50% to 75% of normal dose.

Dosing: Hepatic ImpairmentAvoid in severe liver disease.

Dosing: Adjustment for Toxicity

QT_c >450-499 msecs: Monitor QT_c more frequently

QT_c ≥500 msecs: Consider discontinuation or reducing methadone dose

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Fentanyl Transdermal Conversion
- Opioid Agonist Conversion

Administration: I.V. DetailpH: 4.5-6.5

Administration: OralOral dose for detoxification and maintenance may be administered in fruit juice or water. Dispersible tablet should not be chewed or swallowed; add to liquid and allow to dissolve before administering. May rinse if residual remains.

Storage

Injection: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

Oral concentrate, oral solution, tablet: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F).

CompatibilityStable in NS.

RestrictionsC-II

When used for treatment of opioid addiction: May only be dispensed in accordance to guidelines established by the Substance Abuse and Mental Health Services Administration’s (SAMHSA) Center for Substance Abuse Treatment (CSAT). Regulations regarding methadone use may vary by state and/or country. Obtain advice from appropriate regulatory agencies and/or consult with pain management/palliative care specialists.

Note: Regulatory Exceptions to the General Requirement to Provide Opioid Agonist Treatment (per manufacturer's labeling):

1. During inpatient care, when the patient was admitted for any condition other than concurrent opioid addiction, to facilitate the treatment of the primary admitting diagnosis.

2. During an emergency period of no longer than 3 days while definitive care for the addiction is being sought in an appropriately licensed facility.

ContraindicationsHypersensitivity to methadone or any component of the formulation; respiratory depression (in the absence of resuscitative equipment or in an unmonitored setting); acute bronchial asthma or hypercarbia; paralytic ileus; concurrent use of selegiline

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Opioid addiction use: See “Other warnings/precautions” below.

- QT prolongation: See “Concerns related to adverse effects” below.

- Respiratory depression: See “Concerns related to adverse effects” below.

- Tablets: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

- QT_c prolongation: **[U.S. Boxed Warning]: May prolong the QT_c interval and increase risk for torsade de pointes.** Patients should be informed of the potential arrhythmia risk, evaluated for any history of structural heart disease, arrhythmia, syncope, and for existence of potential drug interactions including drugs that possess QT_c interval-prolonging properties, promote hypokalemia, hypomagnesemia, or hypocalcemia, or reduce elimination of methadone (eg, CYP3A4 inhibitors). Obtain baseline ECG for all patients and risk stratify according to QT_c interval (see Monitoring Parameters). Use with caution in patients at risk for QT_c prolongation, with medications known to prolong the QT_c interval, promote electrolyte depletion, or inhibit CYP3A4, or history of conduction abnormalities. QT_c interval prolongation and torsade de pointes may be associated with doses >100 mg/day, but have also been observed with lower doses.

- Respiratory depression: **[U.S. Boxed Warning]: Severe respiratory depression has occurred with administration.** Use extreme caution during treatment initiation, dose titration and conversion from other opioid agonists to methadone. Peak respiratory depressant effects occur later and persist longer than peak analgesic effects possibly contributing to cases of iatrogenic overdose.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- CNS depression/coma: Use with caution in patients with CNS depression or coma.

- Depression: Use with caution in patients with depression or suicidal tendencies.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with severe hepatic failure.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urethral stricture: Use with caution in patients with prostatic hyperplasia and/or urethral stricture.

- Renal impairment: Use with caution in patients with severe renal failure.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages. Because the respiratory effects last longer than the analgesic effects, slow titration is required.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients receiving concurrent use of medications known to inhibit CYP3A4, prolong the QT_c interval, or promote hypokalemia, hypomagnesemia, or hypocalcemia; may require dosage adjustments or use of alternative therapy.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Tablets: **[U.S. Boxed Warning]: For oral administration only;** excipients to deter use by injection are contained in tablets.

Other warnings/precautions:

- Acute pain management: Patients maintained on stable doses may need higher and/or more frequent doses in case of acute pain (eg, postoperative pain, physical trauma).

- Anxiety use: Methadone is ineffective for the relief of anxiety.

- Incomplete cross tolerance: Use caution in converting patients from other opioids to methadone. Follow appropriate conversion schedules. Patients tolerant to other mu opioid agonists may not be tolerant to methadone and at risk for severe respiratory depression when converted to methadone.

- Narcotic addiction use: **[U.S. Boxed Warning]: When used for treatment of narcotic addiction:May only be dispensed by opioid treatment programs when used for treatment of narcotic addiction:** These programs must be certified by the designated state authority; exceptions include inpatient treatment of other conditions and emergency period (not >3 days) while definitive substance abuse treatment is being sought.

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsBecause of it's long half-life and risk of accumulation, methadone is difficult to titrate and is not considered a drug of first choice. It should be prescribed only by physicians who are experienced in using it. Elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)

Pregnancy ConsiderationsTeratogenic effects have been observed in some, but not all, animal studies. Data collected by the Teratogen Information System are complicated by maternal use of illicit drugs, nutrition, infection, and psychosocial circumstances. However, pregnant women in methadone treatment programs are reported to have improved fetal outcomes compared to pregnant women using illicit drugs. Methadone can be detected in the amniotic fluid, cord plasma, and newborn urine. Fetal growth, birth weight, length, and/or head circumference may be decreased in infants born to narcotic-addicted mothers treated with methadone during pregnancy. Growth deficits do not appear to persist; however, decreased performance on psychometric and behavioral tests has been found to continue into childhood. Abnormal fetal nonstress tests have also been reported. Withdrawal symptoms in the neonate may be observed up to 2-4 weeks after delivery. The manufacturer states that methadone should be used during pregnancy only if clearly needed. Because methadone clearance in pregnant women is increased and half-life is decreased during the 2nd and 3rd trimesters of pregnancy, withdrawal symptoms may be observed in the mother; dosage of methadone may need increased or dosing interval decreased during pregnancy.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsPeak methadone levels appear in breast milk 4-5 hours after an oral dose. Methadone has been detected in the plasma of some breast-fed infants whose mothers are taking methadone. Use during breast-feeding is not recommended, and the manufacturer recommends that women on high dose methadone maintenance who already are breast-feeding be instructed to wean breast-feeding gradually to avoid neonatal abstinence syndrome. Sedation and respiratory depression have been reported in nursing infants. Unless otherwise contraindicated (concurrent medical conditions, other medications of abuse), the AAP rates methadone “compatible” with breast-feeding.

Adverse ReactionsFrequency not defined. During prolonged administration, adverse effects may decrease over several weeks; however, constipation and sweating may persist.

Cardiovascular: Arrhythmia, bigeminal rhythms, bradycardia, cardiac arrest, cardiomyopathy, ECG changes, edema, extrasystoles, faintness, flushing, heart failure, hypotension, palpitation, peripheral vasodilation, phlebitis, orthostatic hypotension, QT interval prolonged, shock, syncope, tachycardia, torsade de pointes, T-wave inversion, ventricular fibrillation, ventricular tachycardia,

Central nervous system: Agitation, confusion, disorientation, dizziness, drowsiness, dysphoria, euphoria, hallucination, headache, insomnia, lightheadedness, sedation, seizure

Dermatologic: Hemorrhagic urticaria, pruritus, rash, urticaria

Endocrine & metabolic: Antidiuretic effect, amenorrhea, hypokalemia, hypomagnesemia, libido decreased

Gastrointestinal: Abdominal pain, anorexia, biliary tract spasm, constipation, glossitis, nausea, stomach cramps, vomiting, weight gain, xerostomia

Genitourinary: Impotence, urinary retention or hesitancy

Hematologic: Thrombocytopenia (reversible, reported in patients with chronic hepatitis)

Neuromuscular & skeletal: Weakness

Local: I.M./SubQ injection: Erythema, pain, swelling; I.V. injection: Hemorrhagic urticaria (rare), pruritus, urticaria, rash

Ocular: Miosis, visual disturbances

Respiratory: Pulmonary edema, respiratory depression, respiratory arrest

Miscellaneous: Death, diaphoresis, physical and psychological dependence

Oncology: VesicantNo

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor), 2C19 (minor), 2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (moderate), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Methadone. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Didanosine: Methadone may decrease the serum concentration of Didanosine. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of Methadone. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Methadone. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Methadone. **Exceptions:** Atazanavir; Indinavir. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Reverse Transcriptase Inhibitors (Non-Nucleoside): May increase the metabolism of Methadone. **Exceptions:** Delavirdine; Etravirine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Methadone. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Zidovudine: Methadone may increase the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS effects). Watch for sedation.

Herb/Nutraceutical: Avoid St John's wort (may decrease methadone levels; may increase CNS depression). Avoid valerian, kava kava, gotu kola (may increase CNS depression). Methadone is metabolized by CYP3A4 in the intestines; avoid concurrent use of grapefruit juice.

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersObtain baseline ECG (evaluate QT_c interval), within 30 days of initiation, and then annually for all patients receiving methadone. Increase ECG monitoring if patient receiving >100 mg/day or if unexplained syncope or seizure occurs while on methadone (Krantz, 2008).

If before or at anytime during therapy:

QT_c >450-499 msecs: Discuss potential risks and benefits; monitor QT_c more frequently

QT_c ≥500 msecs: Consider discontinuation or reducing methadone dose **or** eliminate factors promoting QT_c prolongation (eg, potassium-wasting drugs) **or** use alternative therapy (eg, buprenorphine)

Pain relief, respiratory and mental status, blood pressure

Reference RangePrevention of opiate withdrawal: Therapeutic: 100-400 ng/mL (SI: 0.32-1.29 µmol/L); Toxic: >2 mcg/mL (SI: >6.46 µmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness and adverse reactions of overdose at beginning of therapy and at regular intervals with long-term use. May cause physical and/or psychological dependence. Monitor blood pressure, respiratory and CNS status (degree of sedation). For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered) adverse reactions to report, and appropriate interventions to reduce side effects. Discontinue slowly after prolonged use.

Patient Education If self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); loss of appetite, nausea, or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report chest pain, slow or rapid heartbeat, acute dizziness or persistent headache; changes in mental status; swelling of extremities or unusual weight gain; changes in urinary elimination; acute headache; back or flank pain or muscle spasms; blurred vision; skin rash; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. If you are breast-feeding, consult prescriber.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 10 mg/mL (20 mL)

Solution, oral, as hydrochloride: 5 mg/5 mL (500 mL); 10 mg/5 mL (500 mL) [contains alcohol 8%; citrus flavor]

Solution, oral, as hydrochloride [concentrate]: 10 mg/mL (946 mL)

- Methadone Intensol™: 10 mg/mL (30 mL)
- Methadose®: 10 mg/mL (1000 mL) [cherry flavor]
- Methadose®: 10 mg/mL (1000 mL) [dye free, sugar free, unflavored]

Tablet, as hydrochloride: 5 mg, 10 mg

- Dolophine®: 5 mg, 10 mg
- Methadose®: 5 mg, 10 mg [DSC]

Tablet, dispersible, as hydrochloride: 40 mg

- Methadose®: 40 mg
- Methadone Diskets®: 40 mg [orange-pineapple flavor]

Generic Available Yes

Pricing: U.S. (www.drugstore.com)

Tablet,Dispersible (Methadone HCl Diskets)

- 40 mg (20): $16.66

Tablets (Methadone HCl)

- 5 mg (20): $11.99
- 10 mg (20): $11.33

Tablets (Methadose)

- 5 mg (20): $11.33
- 10 mg (20): $11.99

Mechanism of Action Binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression

Pharmacodynamics/Kinetics

Onset of action: Oral: Analgesic: 0.5-1 hour; Parenteral: 10-20 minutes

- Peak effect: Parenteral: 1-2 hours; Oral: continuous dosing: 3-5 days

Duration of analgesia: Oral: 4-8 hours, increases to 22-48 hours with repeated doses

Distribution: V_{dss}: 1-8 L/kg

Protein binding: 85% to 90%

Metabolism: Hepatic; N-demethylation primarily via CYP3A4, CYP2B6, and CYP2C19 to inactive metabolites

Bioavailability: Oral: 36% to 100%

Half-life elimination: 8-59 hours; may be prolonged with alkaline pH, decreased during pregnancy

Time to peak, plasma: 1-7.5 hours

Excretion: Urine (<10% as unchanged drug); increased with urine pH <6

Dental Health Professional ConsiderationsThis drug is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Methadone is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation) and glossitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsMethadone Hydrochloride

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children's Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Desoxyn® may be confused with digoxin

Pronunciation(meth am FET a meen)
U.S. Brand NamesDesoxyn®
Canadian Brand NamesDesoxyn®
Pharmacologic CategoryAnorexiant; Stimulant; Sympathomimetic
Use: Labeled IndicationsTreatment of attention-deficit/hyperactivity disorder (ADHD); exogenous obesity (short-term adjunct)
Use: Unlabeled/InvestigationalNarcolepsy
Dosing: Adults

ADHD: Oral: 5 mg 1-2 times/day, may increase by 5 mg increments weekly until optimum response is achieved, usually 20-25 mg/day

Exogenous obesity: Oral: 5 mg, 30 minutes before each meal; treatment duration should not exceed a few weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

ADHD: Oral: Children ≥6 years: Refer to adult dosing.

Exogenous obesity: Oral: Children ≥12 years: Refer to adult dosing.

Calculations

- Body Mass Index

Dietary ConsiderationsMost effective when combined with a low calorie diet and behavior modification counseling.
StorageStore below 30°C (86°F). Protect from light.
RestrictionsC-II

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/drug/infopage/ADHD/default.htm.

Pharmacotherapy for weight loss is recommended only for obese patients with a body mass index ≥30 kg/m^2, or ≥27 kg/m^2 in the presence of other risk factors such as hypertension, diabetes, and/or dyslipidemia or a high waist circumference; therapy should be used in conjunction with a comprehensive weight management program. Rule out organic causes of obesity (eg, untreated hypothyroidism) prior to use.

Note: Methamphetamine is not approved for long-term use. The limited usefulness of medications in this class should be weighed against possible risks associated with their use. Consult weight loss guidelines for current pharmacotherapy recommendations.

ContraindicationsHypersensitivity to methamphetamine, any component of the formulation, or idiosyncrasy to amphetamines or other sympathomimetic amines; patients with advanced arteriosclerosis, symptomatic cardiovascular disease, moderate-to-severe hypertension, hyperthyroidism, glaucoma, agitated states; patients with a history of drug abuse; use during or within 14 days following MAO inhibitor therapy; stimulant medications are contraindicated for use in children with attention-deficit/hyperactivity disorders and concomitant Tourette's syndrome or tics
Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Boxed warnings:

- Drug abuse: See “Disease-related concerns” below.
- Weight reduction: Appropriate use: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Cardiovascular events: Use has been associated with serious cardiovascular events including sudden death in patients with pre-existing structural cardiac abnormalities or other serious heart problems (sudden death in children and adolescents; sudden death, stroke and MI in adults). These products should be avoided in the patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry. Patients should be carefully evaluated for cardiac disease prior to initiation of therapy.

- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities.

- Visual disturbance: Difficulty in accommodation and blurred vision has been reported with the use of stimulants.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; antidiabetic agent requirements may be altered with anorexigens and concomitant dietary restrictions.

- Drug abuse: **[U.S. Boxed Warning]: Potential for drug dependency exists; prolonged use may lead to drug dependency.** Use is contraindicated in patients with history of ethanol or drug abuse. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.

- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate. Use is contraindicated in patients with moderate to severe hypertension.

- Psychiatric disorders: Use with caution in patients with pre-existing psychosis or bipolar disorder (may induce mixed/manic episode). May exacerbate symptoms of behavior and thought disorder in psychotic patients; new onset psychosis or mania may occur with stimulant use; observe for symptoms of aggression and/or hostility.

- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold leading to new onset or breakthrough seizure activity.

- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

- Weight reduction: Appropriate use: **[U.S. Boxed Warning]: Use in weight reduction programs only when alternative therapy has been ineffective.**

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age for obesity. Use of stimulants has been associated with suppression of growth; monitor growth rate during treatment.

Other warnings/precautions:

- Discontinuation of therapy: Abrupt discontinuation following high doses or for prolonged periods may result in symptoms for withdrawal. Discontinue if satisfactory weight loss has not occurred within the first 4 weeks of treatment, or if tolerance develops.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic and embryocidal effects have been observed in animal studies. Infants may deliver prematurely and suffer withdrawal symptoms. There are no adequate and well-controlled studies in pregnant women.
LactationEnters breast milk/contraindicated
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, tachycardia, palpitation

Central nervous system: Restlessness, headache, exacerbation of motor and phonic tics and Tourette's syndrome, dizziness, psychosis, dysphoria, overstimulation, euphoria, insomnia

Dermatologic: Rash, urticaria

Endocrine & metabolic: Change in libido

Gastrointestinal: Diarrhea, nausea, vomiting, stomach cramps, constipation, anorexia, weight loss, xerostomia, unpleasant taste

Genitourinary: Impotence

Neuromuscular & skeletal: Tremor

Miscellaneous: Suppression of growth in children, tolerance and withdrawal with prolonged use

Metabolism/Transport Effects**Substrate** of CYP2D6 (major)
Drug Interactions

Alkalinizing Agents: May decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Ammonium Chloride: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Amphetamines may enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Antihistamines: Amphetamines may diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antipsychotics: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Amphetamines. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Ethosuximide: Amphetamines may diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Gastrointestinal Acidifying Agents: May decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Methenamine: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

PHENobarbital: Amphetamines may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Amphetamines may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause CNS depression).

Food: Amphetamine serum levels may be altered if taken with acidic food, juices, or vitamin C. Avoid caffeine.

Herb/Nutraceutical: Avoid ephedra (may cause hypertension or arrhythmias).

Monitoring ParametersHeart rate, respiratory rate, blood pressure, CNS activity, body weight (BMI); growth rate in children

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Reference Range

Adult classification of weight by BMI (kg/m^2):

Underweight: <18.5

Normal: 18.5-24.9

Overweight: 25-29.9

Obese, class I: 30-34.9

Obese, class II: 35-39.9

Extreme obesity (class III): ≥40

Waist circumference: In adults with a BMI of 25-34.9 kg/m^2, high-risk waist circumference is defined as:

Men >102 cm (>40 in)

Women >88 cm (>35 in)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Desoxyn)

5 mg (90): $366.81

Mechanism of ActionA sympathomimetic amine related to ephedrine and amphetamine with CNS stimulant activity; peripheral actions include elevation of systolic and diastolic blood pressure and weak bronchodilator and respiratory stimulant action

Pharmacodynamics/Kinetics

Absorption: Rapid from GI tract

Metabolism: Hepatic; forms metabolite

Half-life elimination: 4-5 hours

Excretion: Urine primarily (dependent on urine pH)

Related Information

- Obesity Treatment Guidelines for Adults
- Stimulant Agents Used for ADHD

Pharmacotherapy PearlsIllicit methamphetamine may contain lead; alkalinizing urine can result in longer methamphetamine half-life and elevated blood level; ephedrine is a precursor in the illicit manufacture of methamphetamine; ephedrine is extracted by dissolving ephedrine tablets in water or alcohol (50,000 tablets can result in 1 kg of ephedrine); conversion to methamphetamine occurs at a rate of 50% to 70% of the weight of ephedrine. 3,4-methylene dioxymethamphetamine (slang: XTC, Ecstasy, Adam) affects the serotonergic, dopaminergic, and noradrenergic pathways. As such, it can cause the serotonin syndrome associated with malignant hyperthermia and rhabdomyolysis.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and unpleasant taste. Up to 10% of patients taking methamphetamine may present with hypertension. Monitor blood pressure prior to using local anesthetic with vasoconstrictors.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution in patients taking methamphetamine. Amphetamines enhance the sympathomimetic response of epinephrine and norepinephrine leading to potential hypertension and cardiotoxicity.

Cardiovascular ConsiderationsAmphetamines should be avoided in patients with known or suspected cardiovascular disease. They may precipitate marked increases in blood pressure, tachycardia, and tachyarrhythmias. These drugs are often used recreationally and inappropriately, particularly for appetite suppressant effects. Recreational use of amphetamines should be considered in otherwise healthy patients with new onset hypertension, tachycardia, or tachyarrhythmias.

Index TermsDesoxyephedrine Hydrochloride; Methamphetamine Hydrochloride

International Brand NamesCidrin (CL); Desoxyn (CA)

Methazolamide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Methazolamide may be confused with methenamine, metolazone

Neptazane® may be confused with Nesacaine®

Pronunciation(meth a ZOE la mide)

Canadian Brand NamesApo-Methazolamide®

Pharmacologic CategoryCarbonic Anhydrase Inhibitor; Diuretic, Carbonic Anhydrase Inhibitor; Ophthalmic Agent, Antiglaucoma

Use: Labeled IndicationsAdjunctive treatment of open-angle or secondary glaucoma; short-term therapy of narrow-angle glaucoma when delay of surgery is desired

Dosing: Adults**Glaucoma:** Oral: 50-100 mg 2-3 times/day

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to methazolamide or any component of the formulation; marked kidney or liver dysfunction; severe pulmonary obstruction

Allergy Considerations

- Carbonic Anhydrase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May impair mental alertness and/or physical coordination.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Respiratory acidosis: Use with caution in patients with respiratory acidosis.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to side effects.

Geriatric ConsiderationsMalaise and complaints of tiredness and myalgia are signs of excessive dosing and acidosis in the elderly.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Central nervous system: Malaise, fever, mental depression, drowsiness, dizziness, nervousness, headache, confusion, seizure, fatigue, trembling, unsteadiness

Dermatologic: Urticaria, pruritus, photosensitivity, rash, Stevens-Johnson syndrome

Endocrine & metabolic: Hyperchloremic metabolic acidosis, hypokalemia, hyperglycemia

Gastrointestinal: Metallic taste, anorexia, nausea, vomiting, diarrhea, constipation, weight loss, GI irritation, xerostomia, black tarry stools

Genitourinary: Polyuria, crystalluria, hematuria, renal calculi, impotence

Hematologic: Bone marrow depression, thrombocytopenia, thrombocytopenic purpura, hemolytic anemia, leukopenia, pancytopenia, agranulocytosis

Hepatic: Hepatic insufficiency

Neuromuscular & skeletal: Weakness, ataxia, paresthesia

Miscellaneous: Hypersensitivity

Drug Interactions

Alpha-/Beta-Agonists: Carbonic Anhydrase Inhibitors may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amphetamines: Carbonic Anhydrase Inhibitors may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Barbiturate): Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Anticonvulsants (Hydantoin). Specifically, osteomalacia and rickets. *Risk C: Monitor therapy*

CarBAMazepine: Carbonic Anhydrase Inhibitors may increase the serum concentration of CarBAMazepine. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Flecainide: Carbonic Anhydrase Inhibitors may decrease the excretion of Flecainide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Memantine: Carbonic Anhydrase Inhibitors may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Methenamine: Carbonic Anhydrase Inhibitors may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Primidone: Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Primidone. Specifically, osteomalacia and rickets. Carbonic Anhydrase Inhibitors may decrease the serum concentration of Primidone. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Carbonic Anhydrase Inhibitors may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Trientine: Carbonic Anhydrase Inhibitor Diuretics may decrease the serum concentration of Trientine. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess allergy history. Monitor blood pressure prior to beginning therapy and after first few doses, especially patients on another concomitant diuretic therapy. If you have diabetes, blood glucose levels may be elevated. Monitor blood sugars closely. Monitor for and/or teach patient to monitor and report adverse reactions. Use and teach patient postural hypotension precautions.

Patient EducationTake with food; swallow whole, do not chew or crush. You may experience GI upset and loss of appetite; small frequent meals are advised to reduce these effects and the metallic taste that sometimes occurs with this medication. You may experience lightheadedness, depression, dizziness, or weakness for a few days; use caution when driving or engaging in tasks that require alertness until response to drug is known. Report excessive tiredness; loss of appetite; cramping, pain, or weakness in muscles; acute GI symptoms; CNS changes (depression, drowsiness); difficulty or pain on urination; visual changes; or skin rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Methazolamide)

25 mg (60): $22.99

50 mg (60): $20.99

Mechanism of ActionNoncompetitive inhibition of the enzyme carbonic anhydrase; thought that carbonic anhydrase is located at the luminal border of cells of the proximal tubule. When the enzyme is inhibited, there is an increase in urine volume and a change to an alkaline pH with a subsequent decrease in the excretion of titratable acid and ammonia.

Pharmacodynamics/Kinetics

Onset of action: Slow in comparison with acetazolamide (2-4 hours)

Peak effect: 6-8 hours

Duration: 10-18 hours

Absorption: Slow

Distribution: Well into tissue

Protein binding: ~55%

Metabolism: Slowly from GI tract

Half-life elimination: ~14 hours

Excretion: Urine (~25% as unchanged drug)

Related Information

- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause dizziness or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause bone marrow suppression; use caution with clozapine and carbamazepine; may increase lithium excretion but overall effect is minimal; if lithium toxicity is severe, hemodialysis is the treatment of choice

International Brand NamesGlaumetax (AR); Neptazane (FR)

Methenamine and Sodium Acid Phosphate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(meth EN a meen & SOW dee um AS id FOS fate)

U.S. Brand NamesUroqid-Acid® No. 2

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsProphylaxis or suppression of bacteriuria associated with recurrent urinary tract infections

Dosing: AdultsProphylaxis or suppression of bacteriuria: Oral: Initial: 2 tablets 4 times daily; maintenance: 2-4 tablets daily in divided doses

Dosing: ElderlyRefer to adult dosing.

Administration: OralAdminister each dose with a full glass of water.

Dietary ConsiderationsLarge amounts of citrus fruit, vegetables, milk or dairy products should not be consumed until the effects on urine pH are known. Each tablet contains 83 mg of sodium

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to methenamine or any component of the formulation; patients with renal insufficiency, severe hepatic disease, severe dehydration, or hyperphosphatemia

Warnings/Precautions

Concerns related to adverse effects:

- Increased serum phosphate: May cause increased serum phosphate levels and subsequent peripheral calcification deposits.
- Metabolic acidosis: Possible risk of metabolic acidosis.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease, edema, and/or hypertension.
- Hypoparathyroidism: Use with caution in patients with hypoparathyroidism.
- Pancreatitis: Use with caution in patients with acute pancreatitis.
- Parenchymal infection: Appropriate use: Should not be used as monotherapy in patients with parenchymal infection associated with fever/chills.

Concurrent drug therapy issues:

- Drugs known to alkalinize urine: Avoid drugs (eg, antacids) which are known to alkalinize the urine (bactericidal activity is lost at urinary pH >6).

Special populations:

- Pregnancy: Use with caution in patients with toxemia of pregnancy.
- Sodium-restricted diet: Use with caution in patients on a sodium-restricted diet.

Other warnings/precautions:

- Appropriate use: Avoid drugs foods (eg, fruits, milk or dairy products) which are known to alkalinize the urine (bactericidal activity is lost at urinary pH >6). Conduct frequent urine pH tests; do not use if acidification of the urine is not achievable. Proteus vulgaris and urea-splitting strains of *Pseudomonas* and *Aerobacter* may be particularly difficult to treat at higher pH. Doses of 8 g/day of methenamine for 3-4 weeks may cause bladder irritation.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Methenamine does cross the placental barrier. Use only if benefit outweighs risk.

LactationEnters breast milk/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, irregular heartbeat, tachycardia

Central nervous system: Asthenia, dizziness, headaches, mental confusion, numbness, pain, seizure, tingling

Dermatologic: Skin rash

Endocrine & metabolic: Metabolic acidosis, thirst

Gastrointestinal: Diarrhea, nausea, vomiting, stomach pain, weight gain

Genitourinary: Bladder irritation, dysuria, painful urination

Neuromuscular & skeletal: Bone/joint pain, muscle cramps

Renal: Albuminuria, hematuria, oliguria

Respiratory: Dyspnea

Drug Interactions

Amphetamines: Methenamine may decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Antacids: May diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May diminish the therapeutic effect of Methenamine. **Exceptions:** Brinzolamide; Dorzolamide. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Citrus fruit, vegetables, and certain milk and dairy products may decrease efficacy of methenamine by raising urinary pH.

Test InteractionsPresence of urinary formaldehyde may lead to falsely-elevated levels of of urinary catecholamines and vanillylmandelic acid (fluorometric detection); falsely-elevated urinary estriol (acid hydrolysis technique) and 17-hydroxycorticosteroid (Porter-Silber method) and decreased 5-hydroxyindolacetate (nitrosonaphthol method).

Monitoring ParametersUrine pH, renal function, serum sodium and phosphate levels

Monitoring: Lab TestsUrine pH, renal function, serum sodium and phosphate levels

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Methenamine mandelate 500 mg and sodium acid phosphate 500 mg [contains 83 mg sodium]

Manufacturer

Beach Products Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Uroqid #2)

500-500 mg (30): $21.99

Mechanism of ActionMethenamine is hydrolyzed in acidic urine (pH <5.5) to produce formaldehyde, which exerts local nonspecific bactericidal activity. Mandelic acid aids in the acidification of the urine and also exhibits some additional bactericidal activity.

Mental Health: Effects on Mental StatusMay cause confusion or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsMethenamine Mandelate and Sodium Acid Phosphate; Sodium Acid Phosphate and Methenamine

---

Methenamine, Phenyl Salicylate, Methylene Blue, Benzoic Acid, and Hyoscyamine

Pronunciation(meth EN a meen, fen nil sa LIS i late, METH i leen bloo, ben ZOE ik AS id & hye oh SYE a meen)
U.S. Brand NamesProsed®/DS
Pharmacologic CategoryAntibiotic, Miscellaneous
Use: Labeled IndicationsUrinary tract discomfort secondary to hypermotility resulting from infection or diagnostic procedures
Dosing: Adults**Urinary tract symptoms:** Oral: One tablet 4 times daily
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Urinary tract symptoms:** Children >12 years: Oral: Dosage must be individualized
Administration: OralAdministration should be followed by liberal fluid intake.
Dietary ConsiderationsFoods/diets which alkalinize urine pH >5.5 decrease activity of methenamine; cranberry juice can be used to acidify urine and increase activity of methenamine.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to methenamine, hyoscyamine, methylene blue, phenyl salicylate, benzoic acid, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Belladonna alkaloid allergy: Use with caution in patients with a history of intolerance to belladonna alkaloids.
- Blurred vision: Discontinue use immediately if blurred vision occurs.
- Dizziness: Discontinue use immediately if dizziness occurs.
- Salicylate allergy: Use with caution in patients with a history of intolerance to salicylates.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.
- Tachycardia: Discontinue use immediately if tachycardia occurs.

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with pyloric or duodenal obstruction, or gastric ulcers.
- Glaucoma: Use with caution in patients with glaucoma.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Obstructive uropathy: Use with caution in patients with obstructive uropathy (bladder neck obstruction or prostatic hyperplasia).

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to anticholinergic effects of hyoscyamine.
- Pediatrics: This combination is not recommended for use in children ≤12 years of age.

Other warnings/precautions:

- Urine/stool discoloration: May cause urinary and/or stool discoloration (blue).

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsMethenamine and hyoscyamine are excreted in breast milk. Refer to individual monographs.
Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing, tachycardia

Central nervous system: Dizziness

Gastrointestinal: Discoloration of stool (blue), nausea, vomiting, xerostomia

Genitourinary: Discoloration of urine (blue), micturition difficulty, urinary retention (acute)

Ocular: Blurred vision

Respiratory: Dyspnea

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Amphetamines: Methenamine may decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Antacids: May diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May diminish the therapeutic effect of Methenamine. **Exceptions:** Brinzolamide; Dorzolamide. *Risk D: Consider therapy modification*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, oral:

Medication Safety Issues

Sound-alike/look-alike issues:

Methenamine may be confused with mesalamine, methazolamide, methionine

Urex® may be confused with Eurax®, Serax®

International issues:

Urex®: Brand name for furosemide in Australia

Pronunciation(meth EN a meen)

U.S. Brand NamesHiprex®; Mandelamine® [DSC]; Urex™

Canadian Brand NamesDehydral®; Hiprex®; Mandelamine®; Urasal®; Urex™

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsProphylaxis or suppression of recurrent urinary tract infections; urinary tract discomfort secondary to hypermotility

Dosing: Adults**Urinary tract infection:** Oral:

Hippurate: 1 g twice daily

Mandelate: 1 g 4 times/day after meals and at bedtime

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Urinary tract infection:** Oral:

>2-6 years: *Mandelate:* 50-75 mg/kg/day in 3-4 doses or 0.25 g/30 lb 4 times/day

6-12 years:

Hippurate: 0.5-1 g twice daily

Mandelate: 50-75 mg/kg/day in 3-4 doses or 0.5 g 4 times/day

>12 years: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Avoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in effect. Foods/diets which alkalinize urine pH >5.5 decrease activity of methenamine.

Dietary ConsiderationsFoods/diets which alkalinize urine pH >5.5 decrease activity of methenamine; cranberry juice can be used to acidify urine and increase activity of methenamine. Hiprex® contains tartrazine dye.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to methenamine or any component of the formulation; severe dehydration, renal insufficiency, severe hepatic insufficiency; concurrent treatment with sulfonamides

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Gout: Use with caution in patients with gout.

- Hepatic impairment: Use with caution in patients with hepatic impairment; reversible increases in LFTs have occurred during therapy especially in patients with hepatic dysfunction. Contraindicated in patients with severe impairment.

Special populations:

- Elderly: Use with caution in the elderly.

Dosage form specific issues:

- Tartrazine: Hiprex® contains tartrazine dye, which may cause allergic reactions in certain individuals.

Other warnings/precautions:

- Appropriate use: Should not be used to treat infections outside of the lower urinary tract; doses of 8 g/day for 3-4 weeks may cause bladder irritation. Use care to maintain an acid pH of the urine, especially when treating infections due to urea splitting organisms (eg, *Proteus* and strains of *Pseudomonas*)

Geriatric ConsiderationsMethenamine has little, if any, role in the treatment or prevention of infections in patients with indwelling urinary (Foley) catheters. Furthermore, in noncatheterized patients, more effective antibiotics are available for the prevention or treatment of urinary tract infections. The influence of decreased renal function on the pharmacologic effects of methenamine results are unknown.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAdverse events were observed in some animal studies. Following a single 1 g dose of methenamine hippurate given prior to delivery, methenamine was found to slowly pass through the placental barrier. There were no signs of accumulation in the fetal circulation. Actual concentrations in the amniotic fluid varied. Methenamine has been considered to be "probably safe" for use during pregnancy. Methenamine has been shown to interfere with urine oestriol concentrations during pregnancy; serum levels are not affected.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsThe concentration of methenamine hippurate in breast milk is approximately the same as that in the maternal plasma. The amount ingested by a breast-feeding infant is considered to be below a therapeutic dose.
Adverse Reactions<4%:

Dermatologic: Pruritus, rash

Gastrointestinal: Dyspepsia, nausea, vomiting

Hepatic: ALT increased (reversible; rare), AST increased (reversible; rare)

Note: Large doses (higher than recommended) have resulted in bladder irritation, frequent/painful micturition, albuminuria, and hematuria.

Drug Interactions

Amphetamines: Methenamine may decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Antacids: May diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May diminish the therapeutic effect of Methenamine. **Exceptions:** Brinzolamide; Dorzolamide. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Foods/diets which alkalinize urine pH >5.5 decrease therapeutic effect of methenamine.
Test InteractionsIncreased urinary catecholamines, 17-hydroxycorticosteroid and vanillylmandelic acid (VMA) levels; decreased urinary 5-hydroxyindoleacetic acid (5HIAA) and estriol levels
Monitoring ParametersUrinalysis, periodic liver function tests
Nursing: Physical Assessment/MonitoringMethenamine should not be used to treat infections outside of the lower urinary tract. Assess potential for interactions with other pharmacological agents patient may be taking (eg, anything that alkalizes urine or sulfonamides). Assess therapeutic effectiveness (urinalysis, indicates resolution of infection) and adverse response. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsUrinalysis, periodic liver function
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take per recommended schedule, at regular intervals around-the-clock. Complete full course of therapy; do not skip doses. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid excessive citrus fruits, milk, or alkalizing medications. May cause nausea or vomiting or GI upset (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report pain on urination or blood in urine, skin rash, other persistent adverse effects, or if condition does not improve. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

1 g (20): $49.90

Tablets (Mandelamine)

0.5 g (120): $76.00

Tablets (Methenamine Hippurate)

1 g (100): $99.99

Tablets (Urex)

1 g (30): $45.99

Mechanism of ActionMethenamine is hydrolyzed to formaldehyde and ammonia in acidic urine; formaldehyde has nonspecific bactericidal action. Other components, hippuric acid or mandelic acid, aid in maintaining urine acidity and may aid in suppressing bacteria.

Pharmacodynamics/Kinetics

Absorption: Readily

Metabolism: Gastric juices: Hydrolyze 10% to 30% unless protected via enteric coating; Hepatic: ~10% to 25%

Half-life elimination: 3-6 hours

Excretion: Urine (90% as unchanged drug) within 24 hours

Pharmacotherapy PearlsShould not be used to treat infections outside of the lower urinary tract. Methenamine has little, if any, role in the treatment or prevention of infections in patients with indwelling urinary (Foley) catheters. Furthermore, in noncatheterized patients, more effective antibiotics are available for the prevention or treatment of urinary tract infections. The influence of decreased renal function on the pharmacologic effects of methenamine results are unknown.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsHexamethylenetetramine; Methenamine Hippurate; Methenamine Mandelate

Methimazole

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Methimazole may be confused with metolazone

Pronunciation(meth IM a zole)

U.S. Brand NamesNorthyx™; Tapazole®

Canadian Brand NamesDom-Methimazole; PHL-Methimazole; Tapazole®

Pharmacologic Category[Antithyroid Agent](); [Thioamide]()

Use: Labeled IndicationsPalliative treatment of hyperthyroidism, return the hyperthyroid patient to a normal metabolic state prior to thyroidectomy, and to control thyrotoxic crisis that may accompany thyroidectomy

Dosing: Adults

Hyperthyroidism: Oral:

Initial: 15 mg/day in 3 divided doses (approximately every 8 hours) for mild hyperthyroidism; 30-40 mg/day in moderately severe hyperthyroidism; 60 mg/day in severe hyperthyroidism; maintenance: 5-15 mg/day (may be given as a single daily dose in many patients)

Adjustment: Adjust dosage as required to achieve and maintain serum T_3, T_4, and TSH levels in the normal range. An elevated T_3 may be the sole indicator of inadequate treatment. An elevated TSH indicates excessive antithyroid treatment.

Thyrotoxic crisis: Recommendations vary widely and have not been evaluated in comparative trials: Dosages of 20-30 mg every 6-12 hours have been recommended for short-term initial therapy, followed by gradual reduction to a maintenance dosage (5-15 mg/day). Rectal administration has been described (Nabil, 1982).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Administer in 3 equally divided doses at approcximately 8-hour intervals.

Hyperthyroidism: Oral:

Initial: 0.4 mg/kg/day in 3 divided doses; maintenance: 0.2 mg/kg/day in 3 divided doses up to 30 mg/24 hours maximum

Alternatively: Initial: 0.5-0.7 mg/kg/day **or** 15-20 mg/m^2/day in 3 divided doses

Maintenance:$^1/_3$ to $^2/_3$ of the initial dose beginning when the patient is euthyroid

Maximum: 30 mg/24 hours

Calculations

- [Body Surface Area: Pediatrics]()

Administration: OtherIn thyroid storm, rectal administration has been attempted (Nabil, 1982).

Dietary ConsiderationsShould be taken consistently in relation to meals every day.

StorageProtect from light.

ContraindicationsHypersensitivity to methimazole or any component of the formulation; breast-feeding (per manufacturer; however, expert analysis and the AAP state this drug may be used in nursing mothers)

Allergy Considerations

- [Thioureylene Allergy]()

Warnings/Precautions

Concerns related to adverse effects:

- Acneiform eruptions: May cause acneiform eruptions.
- Bleeding: May cause hypoprothrombinemia and bleeding; use with particular caution in patients >40 years of age.
- Bone marrow suppression: May cause significant bone marrow depression; the most severe manifestation is agranulocytosis. Aplastic anemia, thrombocytopenia, and leukopenia may also occur. Use with caution in patients receiving other drugs known to cause myelosuppression particularly agranulocytosis, in patients >40 years of age, and avoid doses >40 mg/day. Discontinue if significant bone marrow suppression occurs, particularly agranulocytosis or aplastic anemia.
- Dermatitis: Antithyroid agents have been associated with rare but severe dermatologic reactions. Rash and urticaria are more common

dermatologic reactions which may not require discontinuation in all cases; discontinue in the presence of exfoliative dermatitis.

- Fever: Discontinue in the presence of unexplained fever.
- Hepatic reactions: Rare, severe hepatic reactions (hepatic necrosis, hepatitis) may occur. Symptoms suggestive of hepatic dysfunction should prompt evaluation. Discontinue in the presence of hepatitis (transaminase >3 times upper limit of normal).
- Lupus-like syndrome: Antithyroid agents have been associated with a variety of autoimmune reactions, including a lupus-like syndrome. Discontinuation may be warranted.
- Vasculitis: Antithyroid agents have been associated (rarely) with the development of ANCA-positive vasculitis or leukocytoclastic vasculitis; prompt discontinuation is warranted in patients who develop vasculitis during therapy.

Geriatric ConsiderationsThe use of antithyroid thioamides is as effective in the elderly as they are in younger adults.
Pregnancy Risk FactorD
Pregnancy ConsiderationsMethimazole crosses the placenta and because adverse events may occur in the fetus following maternal use, it is classified as pregnancy category D. Rare cases of aplasia cutis congenital have been reported in the neonate, as well as a syndrome which includes choanal atresia, facial abnormalities, growth restriction and developmental abnormalities. Additional data is needed to determine any association of these adverse events with maternal methimazole use. Fetal thyroid function may also be transiently suppressed. Untreated hyperthyroidism may also cause adverse events in the mother (eg, heart failure, miscarriage, preeclampsia, thyroid storm); fetus (eg, goiter, growth restriction, hypo/hyperthyroidism, still birth); and neonate (eg, hyper-/hypothyroidism, neuropsychologic damage). The thioamides are treatment of choice for hyperthyroidism during pregnancy. In order to prevent adverse events to the fetus, the lowest effective dose should be used in order to achieve maternal levels of T_4 in the high euthyroid or low hyperthyroid range. Thyroid function should be monitored closely.
LactationEnters breast milk/contraindicated (per manufacturer) (AAP rates “compatible”)
Breast-Feeding ConsiderationsMethimazole is found in breast milk at levels ~0.14% of the weight adjusted maternal dose. Although breast-feeding is contraindicated by the manufacturer, the AAP and other expert analysis have concluded that breast-feeding is generally considered safe. Reviews of thionamide use in breast-feeding have not shown that thyroid function of the breast-fed infant is significantly affected.
Adverse ReactionsFrequency not defined.

Cardiovascular: ANCA-positive vasculitis, edema, leukocytoclastic vasculitis, periarteritis

Central nervous system: CNS stimulation, depression, drowsiness, fever, headache, vertigo

Dermatologic: Alopecia, erythema nodosum, exfoliative dermatitis, pruritus, skin pigmentation, skin rash, urticaria

Endocrine & metabolic: Goiter

Gastrointestinal: Nausea, vomiting, stomach pain, abnormal taste, constipation, weight gain, salivary gland swelling

Hematologic: Agranulocytosis, aplastic anemia, granulocytopenia, hypoprothrombinemia, leukopenia, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatitis, jaundice

Neuromuscular & skeletal: Arthralgia, paresthesia

Renal: Nephritis, nephrotic syndrome

Miscellaneous: SLE-like syndrome

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2A6 (weak), 2B6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (moderate), 2E1 (weak), 3A4 (weak)
Drug Interactions

Sodium Iodide I131: Antithyroid Agents may diminish the therapeutic effect of Sodium Iodide I131. Management: Discontinue antithyroid therapy 3-4 days prior to sodium iodide I-131 administration. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antithyroid Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersMonitor for signs of hypothyroidism, hyperthyroidism, T_4, T_3; CBC with differential, liver function (baseline and as needed), serum thyroxine, free thyroxine index
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological or herbal agents patient may be taking (eg, extreme caution with anything that may cause myelosuppression, may increase or decrease levels/effects of other agents). Assess results of laboratory tests at baseline and periodically. Evaluate therapeutic effectiveness (clinical and laboratory indicators) and adverse reactions during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsT_4, T_3, CBC with differential, liver function (baseline and as needed), serum thyroxine, free thyroxine index
Patient EducationDo not take any new prescription, OTC medications, or herbal products during therapy unless approved by prescriber. Take as directed, at the same time each day, around-the-clock (eg, every 8 hours). Do not miss doses or make up missed doses. This drug will need to be taken for an extended period of time to achieve appropriate results. May cause nausea, vomiting, abdominal pain, or abnormal taste (small, frequent meals may help); dizziness or drowsiness; or unusual CNS stimulation (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report rash, fever, unusual bleeding or bruising, unresolved headache, yellowing of eyes or skin, changes in color of urine or feces, or unresolved malaise. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant and do not get pregnant while taking this medicine. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5 mg, 10 mg, 20 mg

Northyx™: 5 mg, 10 mg, 15 mg, 20 mg

Tapazole®: 5 mg, 10 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Methimazole)

5 mg (90): $31.00

10 mg (100): $63.99

Tablets (Tapazole)

5 mg (100): $81.73

10 mg (100): $134.71

Mechanism of ActionInhibits the synthesis of thyroid hormones by blocking the oxidation of iodine in the thyroid gland, blocking iodine's ability to combine with tyrosine to form thyroxine and triiodothyronine (T_3), does not inactivate circulating T_4 and T_3
Pharmacodynamics/Kinetics

Onset of action: Antithyroid: Oral: 12-18 hours

Duration: 36-72 hours

Distribution: Concentrated in thyroid gland; crosses placenta; enters breast milk (1:1)

Protein binding, plasma: None

Metabolism: Hepatic

Bioavailability: 80% to 95%

Half-life elimination: 4-13 hours

Excretion: Urine (80%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste and salivary gland swelling.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness
Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; use caution with clozapine and carbamazepine; concurrent use with lithium may increase the effects on the thyroid
Anesthesia and Critical Care Concerns/Other ConsiderationsHypothyroidism and congenital defects (rare) may occur. Agranulocytosis, when it occurs, is usually seen during the first several months of therapy and with maintenance doses >40 mg/day.
Index TermsThiamazole

Medication Safety Issues

Sound-alike/look-alike issues:

Methocarbamol may be confused with mephobarbital

Robaxin® may be confused with ribavirin, Rubex®

Pronunciation(meth oh KAR ba mole)

U.S. Brand NamesRobaxin®

Canadian Brand NamesRobaxin®

Pharmacologic CategorySkeletal Muscle Relaxant

Use: Labeled IndicationsTreatment of muscle spasm associated with acute painful musculoskeletal conditions; supportive therapy in tetanus

Use: DentalTreatment of muscle spasm associated with acute temporomandibular joint pain (TMJ)

Dosing: Adults

Muscle spasm:

Oral: 1.5 g 4 times/day for 2-3 days (up to 8 g/day may be given in severe conditions), then decrease to 4-4.5 g/day in 3-6 divided doses

I.M., I.V.: 1 g every 8 hours if oral not possible; injection should not be used for more than 3 consecutive days. If condition persists, may repeat course of therapy after a drug-free interval of 48 hours.

Tetanus: I.V.: Initial dose: 1-3 g; may repeat dose every 6 hours until oral dosing is possible; injection should not be used for more than 3 consecutive days

Dosing: ElderlyMuscle spasm: Oral: Initial: 500 mg 4 times/day; titrate to response

Dosing: Pediatric

Tetanus (recommended **only** for use in tetanus): I.V.: 15 mg/kg/dose or 500 mg/m^2/dose, may repeat every 6 hours if needed; maximum dose: 1.8 g/m^2/day for 3 days only

Muscle spasm: Children ≥16 years: Refer to adult dosing.

Dosing: Renal ImpairmentDo not administer parenteral formulation to patients with renal dysfunction.

Dosing: Hepatic ImpairmentSpecific dosing guidelines are not available. Plasma protein binding and clearance are decreased; half-life is increased.

Calculations

- Body Surface Area: Pediatrics

Administration: I.M.A maximum of 5 mL can be administered into each gluteal region.

Administration: I.V.Maximum rate: 3 mL/minute; injection should not be used for more than 3 consecutive days; may be administered undiluted

Administration: I.V. DetailMonitor closely for extravasation. Administer I.V. while in recumbent position. Maintain position 15-30 minutes following infusion.

Administration: OralTablets may be crushed and mixed with food or liquid if needed. Avoid alcohol.

Storage

Injection: Prior to dilution, store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Injection when diluted to 4 mg/mL in sterile water, 5% dextrose, or 0.9% saline is stable for 6 days at room temperature. Do **not** refrigerate after dilution.

Tablet: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to methocarbamol or any component of the formulation; renal impairment (injection formulation)

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use oral with caution in patients with renal impairment.
- Seizure disorder: Use injection with caution in patients with a history of seizure disorder.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: Oral formulation: Safety and efficacy have not been established in children <16 years of age.

Dosage form specific issues:

- Injection: Rate of injection should not exceed 3 mL/minute; solution is hypertonic; avoid extravasation. Vial stopper contains latex.

Geriatric ConsiderationsThere is no specific information on the use of skeletal muscle relaxants in the elderly. Methocarbamol has a short half-life, so it may be considered one of the safer agents in this class.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. The manufacturer notes that fetal and congenital abnormalities have been rarely reported following *in utero* exposure. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing of face, bradycardia, hypotension, syncope

Central nervous system: Drowsiness, dizziness, lightheadedness, convulsion, vertigo, headache, fever, amnesia, confusion, insomnia, sedation, coordination impaired (mild)

Dermatologic: Allergic dermatitis, urticaria, pruritus, rash, angioneurotic edema

Gastrointestinal: Nausea, vomiting, metallic taste, dyspepsia

Hematologic: Leukopenia

Hepatic: Jaundice

Local: Pain at injection site, thrombophlebitis

Ocular: Nystagmus, blurred vision, diplopia, conjunctivitis

Renal: Renal impairment

Respiratory: Nasal congestion

Miscellaneous: Allergic manifestations, anaphylactic reaction

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pyridostigmine: Methocarbamol may diminish the therapeutic effect of Pyridostigmine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsMay cause color interference in certain screening tests for 5-HIAA using nitrosonaphthol reagent and in screening tests for urinary VMA using the Gitlow method.

Nursing: Physical Assessment/MonitoringAssess other medications for excess CNS depression. Monitor effectiveness of therapy (according to rationale for therapy) and adverse reactions at beginning and periodically during therapy. Monitor I.V. site closely to prevent extravasation. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed. Do not increase dose or discontinue without consulting prescriber. Do not use alcohol, prescriptive or OTC antidepressants, sedatives, or pain medications without consulting prescriber. You may experience drowsiness, dizziness, lightheadedness (avoid driving or engaging in tasks requiring alertness until response to drug is known); or nausea or vomiting (small frequent meals, frequent mouth care, or sucking hard candy may help). Report excessive drowsiness or mental agitation, chest pain, skin rash, swelling of mouth/face, difficulty speaking, or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 100 mg/mL (10 mL) [in polyethylene glycol; vial stopper contains latex]

Tablet: 500 mg, 750 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Tablets (Methocarbamol)

500 mg (60): $14.97

Tablets (Robaxin)

500 mg (30): $39.55

Tablets (Robaxin-750)

750 mg (30): $50.54

Mechanism of ActionCauses skeletal muscle relaxation by general CNS depression

Pharmacodynamics/Kinetics

Onset of action: Muscle relaxation: Oral: ~30 minutes

Protein binding: 46% to 50%

Metabolism: Hepatic via dealkylation and hydroxylation

Half-life elimination: 1-2 hours

Time to peak, serum: ~2 hours

Excretion: Urine (as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common

Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Brevital® may be confused with Brevibloc®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(meth oh HEKS i tal)

U.S. Brand NamesBrevital® Sodium

Canadian Brand NamesBrevital®

Pharmacologic CategoryBarbiturate; General Anesthetic

Use: Labeled IndicationsFor induction of anesthesia prior to the use of other general anesthetic agents; as an adjunct to subpotent inhalational anesthetic agents for short surgical procedures; for short surgical, diagnostic, or therapeutic procedures associated with minimal painful stimuli

Additional indications for adults: For use with other parenteral agents, usually narcotic analgesics, to supplement subpotent inhalational anesthetic agents for longer surgical procedures; as an agent to induce a hypnotic state

Use: Unlabeled/InvestigationalWada test

Use: DentalInduction and maintenance of general anesthesia for short procedures

Dosing: Adults

Anesthesia (doses must be titrated to effect): I.V.: Induction: 1-1.5 mg/kg; maintenance: 50-120 mcg/kg/minute (or 20-40 mg every 4-7 minutes)

Wada test (unlabeled): I.V.: 2-4 mg

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Anesthesia: Doses must be titrated to effect

Infants <1 month: Safety and efficacy not established

Infants ≥1 month and Children: Induction:

I.M.: 6.6-10 mg/kg of a 5% solution

Rectal: Usual: 25 mg/kg of a 1% solution

I.V. (unlabeled dose): 1-2 mg/kg/dose of a 1% solution

Procedural sedation (unlabeled dose): Infants ≥1 month and Children:

I.V.: Initial: 0.5 mg/kg given immediately prior to procedure; if sedation not adequate, repeat 0.5 mg/kg to a maximum total dose of 2 mg/kg

Rectal: 25 mg/kg of a 10% (100 mg/mL) solution given 5-15 minutes prior to procedure; maximum dose 500 mg

Dosing: Hepatic ImpairmentLower dosage and monitor closely.

Administration: I.M.I.M. administration: Use 5% (50 mg/mL) solution

Administration: I.V.

I.V.: Dilute to a maximum concentration of 1% for I.V. use

Induction and maintenance of anesthesia: 1% (10 mg/mL) solution is administered I.V. at a rate of ~1 mL/5 seconds or ~2 mg/second

Wada testing: Dilution of 0.1% (1 mg/mL) has been used; administer I.V. at a rate of 1 mg/second

Continuous I.V. infusion: Use 0.2% (2 mg/mL) solution

Administration: OtherRectal administration: Use 1% (10 mg/mL) solution; 10% (100 mg/mL) solution has also been used (Pomeranz, 2000)

StorageStore at 20°C to 25°C (68°F to 77°F). Reconstituted solutions are chemically stable at room temperature for 24 hours; 0.2% (2 mg/mL) solutions in D_5W or NS are stable at room temperature for 24 hours.

ReconstitutionDo not dilute with solutions containing bacteriostatic agents. Solutions should be freshly prepared and used promptly.

For a 1% (10 mg/mL) solution:

500 mg vial: Dilute with 50 mL with SWFI (preferred), D_5W, or NS

2.5 g vial: Dilute with 15 mL of SWFI (preferred), D_5W, or NS, then add to 235 mL for a total volume of 250 mL

For a 5% (50 mg/mL) solution:

500 mg vial: Dilute with 10 mL of SWFI (preferred), D_5W, or NS

2.5 g vial: Dilute with 50 mL of SWFI (preferred), D_5W, or NS

For a 10% (100 mg/mL) solution:

500 mg vial: Dilute with 5 mL of SWFI (Pomeranz, 2000)

2.5 g vial: Dilute with 25 mL of SWFI (Pomeranz, 2000)

For continuous I.V. anesthesia: Prepare a 0.2% (2 mg/mL) solution by adding 500 mg to 250 mL of D_5W or NS. Do not dilute with SWFI (use of SWFI to make the 0.2% solution will result in extreme hypotonicity).

CompatibilityStable in D_5NS, D_5W, NS.

Note: Solutions are alkaline (pH 9.5-11) and **incompatible** with acids (eg, atropine sulfate, succinylcholine, silicone); also **incompatible** with phenol-containing solutions and silicone.

Y-site administration: Incompatible: Fenoldopam

Compatibility in syringe: Incompatible: Atropine, glycopyrrolate. **Variable (consult detailed reference):** Pancuronium.

Compatibility when admixed: Incompatible: Atracurium, atropine, chlorpromazine, cimetidine, clindamycin, droperidol, fentanyl, hydralazine, kanamycin, lidocaine, mechlorethamine, metaraminol, methyldopate, metocurine, pancuronium, penicillin G, pentazocine, prochlorperazine mesylate, promazine, promethazine, propiomazine, scopolamine, streptomycin, succinylcholine, thiamine, tubocurarine. **Variable (consult detailed reference):** Isoproterenol, norepinephrine.

RestrictionsC-IV

ContraindicationsHypersensitivity to barbiturates, methohexital, or any component of the formulation; porphyria (latent or manifest); patients in whom general anesthesia is contraindicated

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Administration: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.

- Hypotension: May cause hypotension; use with caution in hemodynamically unstable patients (hypotension or shock) or severe hypertension.

Disease-related concerns:

- Anemia: Use with caution in patients with severe anemia; respiratory depression may occur leading to further inadequate tissue oxygenation.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease including heart failure; consider monitoring cardiac function.

- Hepatic impairment: Use with caution in patients with hepatic impairment; may prolong or potentiate hypnotic effect.

- Obesity: Use with caution in patients with extreme obesity.

- Pulmonary disease: May cause respiratory depression; use with caution in patients with pulmonary disease. Use with caution in patients with asthma and chronic obstructive pulmonary disease. Use with extreme caution in patients with ongoing status asthmaticus; hiccups, coughing, laryngospasm, and muscle twitching have occurred impairing ventilation.

- Renal impairment: Use with caution in patients with renal impairment; may prolong or potentiate hypnotic effect.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Elderly: Use with caution in the elderly; closely monitor elderly or debilitated patients for impaired cognitive or motor performance.
- Pediatrics: Use with caution in children.

Other warnings/precautions:

- Administration: **[U.S. Boxed Warning]: Should only be administered in hospitals or ambulatory care settings with continuous monitoring of respiratory function; resuscitative drugs, age- and size-appropriate intubation equipment and trained personnel experienced in handling their use should be readily available. For deeply sedated patients, a healthcare provider other than the individual performing the procedure should be present to continuously monitor the patient.**
- Cumulative effect: Repeated dosing or continuous infusions may cause cumulative effects.
- Intravenous (I.V.) administration: Prior to I.V. administration, ensure patient has adequate I.V. access; extravasation or intra-arterial injection causes necrosis.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal studies have not shown fetal or maternal harm. There are no adequate and well-controlled studies in pregnant women. Methohexital crosses the placenta. Use only if potential benefit outweighs risk to fetus.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsMethohexital is minimally excreted in breast milk and levels decline rapidly after administration. Interruption of breast-feeding is unnecessary.

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiorespiratory arrest, circulatory depression, hypotension, peripheral vascular collapse, tachycardia

Central nervous system: Anxiety, emergence delirium, headache, restlessness, seizure

Dermatologic: Erythema, pruritus, urticaria

Gastrointestinal: Abdominal pain, nausea, salivation, vomiting

Hepatic: Transaminases increased

Local: Injection site pain, nerve injury adjacent to injection site, thrombophlebitis

Neuromuscular & skeletal: Involuntary muscle movement, radial nerve palsy, rigidity, tremor, twitching

Respiratory: Apnea, bronchospasm, cough, dyspnea, hiccups, laryngospasm, respiratory depression, rhinitis

Miscellaneous: Anaphylaxis (rare)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersRespiratory status (for conscious sedation, includes pulse oximetry), cardiovascular status, CNS status (when used for procedures monitor sedation score); cardiac monitor and blood pressure monitor required

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Periodically evaluate the need for continued use. I.V.: Keep patient under observation. Monitor cardio/respiratory status and institute patient safety precautions. Monitor effectiveness of therapy and adverse reactions. Monitor respiratory status (for conscious sedation, includes pulse oximetry), cardiovascular status, CNS status (when used for procedures monitor sedation score); cardiac monitor and blood pressure monitor required.

Patient EducationMay cause drowsiness

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium:

Brevital® Sodium: 500 mg, 2.5 g

Generic AvailableNo

Mechanism of ActionUltra short-acting I.V. barbiturate anesthetic

Pharmacodynamics/Kinetics

Onset of action: I.V.: Immediate; I.M. (pediatrics): 2-10 minutes; Rectal (pediatrics): 5-15 minutes

Duration: Single dose: I.V.: 10-20 minutes; Rectal: 45 minutes

Metabolism: Hepatic via demethylation and oxidation

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentUsed as induction anesthesia for electroconvulsive therapy (ECT); concurrent use with psychotropics may produce additive CNS depression

Anesthesia and Critical Care Concerns/Other ConsiderationsMethohexital does not possess analgesic properties.

Index TermsMethohexital Sodium

Methotrexate-Vinblastine (Desmoid Tumor)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category: Chemotherapy Regimen, Soft Tissue Sarcoma

Regimen Use: Soft tissue sarcoma (Desmoid tumor)

Index Terms: Vinblastine-Methotrexate (Desmoid Tumor)

Regimen

Methotrexate: I.V.: 30 mg/m^2 every 7-10 days

[total dose/treatment = 30 mg/m^2]

Vinblastine: I.V.: 6 mg/m^2 every 7-10 days

[total dose/treatment = 6 mg/m^2]

Continue treatment for 1 year (52 treatments)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Methotrexate may be confused with metolazone, mitoxantrone

MTX is an error-prone abbreviation (mistaken as mitoxantrone)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Errors have occurred (resulting in death) when methotrexate was administered as “daily” dose instead of the recommended “weekly” dose.

International issues:

Trexall™ may be confused with Truxal® which is a brand name for chlorprothixene in Belgium

Trexall™ may be confused with Trexol® which is a brand name for tramadol in Mexico

Pronunciation(meth oh TREKS ate)

U.S. Brand NamesRheumatrex® Dose Pack®; Trexall™

Canadian Brand NamesApo-Methotrexate®; ratio-Methotrexate

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Antifolate); Antirheumatic, Disease Modifying

Use: Labeled IndicationsTreatment of trophoblastic neoplasms; leukemias; psoriasis; rheumatoid arthritis (RA), including polyarticular-course juvenile rheumatoid arthritis (JRA); breast, head and neck, and lung carcinomas; osteosarcoma; soft-tissue sarcomas; carcinoma of gastrointestinal tract, esophagus, testes; lymphomas

Use: Unlabeled/InvestigationalTreatment and maintenance of remission in Crohn’s disease; ectopic pregnancy

Dosing: AdultsRefer to individual protocols.

Note: Doses between 100-500 mg/m^2 **may require** leucovorin rescue. Doses >500 mg/m^2 **require** leucovorin rescue: I.V., I.M., Oral: Leucovorin 10-15 mg/m^2 every 6 hours for 8 or 10 doses, starting 24 hours after the start of methotrexate infusion. Continue until the methotrexate level is ≤0.1 micromolar (10^{-7} M). Some clinicians continue leucovorin until the methotrexate level is <0.05 micromolar (5×10^{-8} M) or 0.01 micromolar (10^{-8} M).

If the 48-hour methotrexate level is >1 micromolar (10^{-6} M) or the 72-hour methotrexate level is >0.2 micromolar (2×10^{-7} M): I.V., I.M, Oral: Leucovorin 100 mg/m^2 every 6 hours until the methotrexate level is ≤0.1 micromolar (10^{-7} M). Some clinicians continue leucovorin until the methotrexate level is <0.05 micromolar (5×10^{-8} M) or 0.01 micromolar (10^{-8} M).

Antineoplastic dosage range: I.V.: Range is wide from 30-40 mg/m^2/week to 100-12,000 mg/m^2 with leucovorin rescue

Trophoblastic neoplasms:

Oral, I.M.: 15-30 mg/day for 5 days; repeat in 7 days for 3-5 courses

I.V.: 11 mg/m^2 days 1 through 5 every 3 weeks

Head and neck cancer: Oral, I.M., I.V.: 25-50 mg/m^2 once weekly

Mycosis fungoides (cutaneous T-cell lymphoma): Oral, I.M.: Initial (early stages):

5-50 mg once weekly **or**

15-37.5 mg twice weekly

Bladder cancer: I.V.:

30 mg/m^2 day 1 and 8 every 3 weeks **or**

30 mg/m^2 day 1, 15, and 22 every 4 weeks

Breast cancer: I.V.: 30-60 mg/m^2 Day 1 and 8 every 3-4 weeks

Gastric cancer: I.V.: 1500 mg/m^2 every 4 weeks

Lymphoma, non-Hodgkin's: I.V.:

30 mg/m^2 days 3 and 10 every 3 weeks **or**

120 mg/m^2 day 8 and 15 every 3-4 weeks **or**

200 mg/m^2 day 8 and 15 every 3 weeks **or**

400 mg/m^2 every 4 weeks for 3 cycles **or**

1 g/m^2 every 3 weeks **or**

1.5 g/m^2 every 4 weeks

Sarcoma: I.V.: 8-12 g/m^2 weekly for 2-4 weeks

Rheumatoid arthritis: Oral: 7.5 mg once weekly **or** 2.5 mg every 12 hours for 3 doses/week, not to exceed 20 mg/week

Psoriasis: Oral: 2.5-5 mg/dose every 12 hours for 3 doses given weekly **or** Oral, I.M.: 10-25 mg/dose given once weekly

Ectopic pregnancy (unlabeled use): I.M.: 50 mg/m^2 single-dose

Active Crohn's disease (unlabeled use): Induction of remission: I.M., SubQ: 15-25 mg once weekly; remission maintenance: 15 mg once weekly

Note: Oral dosing has been reported as effective but oral absorption is highly variable. If patient relapses after a switch to oral, may consider returning to injectable.

Dosing: ElderlyRefer to individual protocols; adjust for renal impairment.

Rheumatoid arthritis/psoriasis: Oral: Initial: 5-7.5 mg/week, not to exceed 20 mg/week

Dosing: PediatricRefer to individual protocols.

Note: Doses between 100-500 mg/m^2**may require** leucovorin rescue. Doses >500 mg/m^2**require** leucovorin rescue: I.V., I.M., Oral: Leucovorin 10-15 mg/m^2 every 6 hours for 8 or 10 doses, starting 24 hours after the start of methotrexate infusion. Continue until the methotrexate level is ≤0.1 micromolar (10^{-7} M). Some clinicians continue leucovorin until the methotrexate level is <0.05 micromolar (5 x 10^{-8} M) or 0.01 micromolar (10^{-8} M).

If the 48-hour methotrexate level is >1 micromolar (10^{-6} M) or the 72-hour methotrexate level is >0.2 micromolar (2 x 10^{-7} M): I.V., I.M, Oral: Leucovorin 100 mg/m^2 every 6 hours until the methotrexate level is ≤0.1 micromolar (10^{-7} M). Some clinicians continue leucovorin until the methotrexate level is <0.05 micromolar (5 x 10^{-8} M) or 0.01 micromolar (10^{-8} M).

Dermatomyositis: Oral: 15-20 mg/m^2/week as a single dose once weekly **or** 0.3-1 mg/kg/dose once weekly

Juvenile rheumatoid arthritis: Oral, I.M.:10 mg/m^2 once weekly, then 5-15 mg/m^2/week as a single dose **or** as 3 divided doses given 12 hours apart

Antineoplastic dosage range:

Oral, I.M.: 7.5-30 mg/m^2/week **or** every 2 weeks

I.V.: 10-18,000 mg/m^2 bolus dosing **or** continuous infusion over 6-42 hours

Pediatric solid tumors (high-dose): I.V.:

<12 years: 12-25 g/m^2

≥12 years: 8 g/m^2

Acute lymphocytic leukemia (intermediate-dose): I.V.: Loading: 100 mg/m^2 bolus dose, followed by 900 mg/m^2/day infusion over 23-41 hours.

Meningeal leukemia: I.T.: 10-15 mg/m^2 (maximum dose: 15 mg) **or** an age-based dosing regimen; one possible system is:

≤3 months: 3 mg/dose

4-11 months: 6 mg/dose

1 year: 8 mg/dose

2 years: 10 mg/dose

≥3 years: 12 mg/dose

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain dosage adjustment guidelines.

The following guidelines have been used by some clinicians:

- Cl_{cr} 61-80 mL/minute: Administer 75% of dose
- Cl_{cr} 51-60 mL/minute: Administer 70% of dose
- Cl_{cr} 10-50 mL/minute: Administer 30% to 50% of dose
- Cl_{cr} <10 mL/minute: Avoid use
- Hemodialysis: Not dialyzable (0% to 5%); supplemental dose is not necessary
- Peritoneal dialysis effects: Supplemental dose is not necessary
- CAVH effects: Unknown

Aronoff, 2007:

- Children:
  - Cl_{cr} 10-50 mL/minute: Administer 50% of dose
  - Cl_{cr} <10 mL/minute: Administer 30% of dose
  - Hemodialysis: Administer 30% of dose
  - Continuous ambulatory peritoneal dialysis (CAPD): Administer 30% of dose
  - Continuous renal replacement therapy (CRRT): Administer 50% of dose
- Adults:
  - Cl_{cr} 10-50 mL/minute: Administer 50% of dose
  - Cl_{cr} <10 mL/minute: Avoid use
  - Hemodialysis: Administer 50% of dose
  - Continuous renal replacement therapy (CRRT): Administer 50% of dose

Kintzel, 1995:

- Cl_{cr} 46-60 mL/minute: Administer 65% of normal dose
- Cl_{cr} 31-45 mL/minute: Administer 50% of normal dose
- Cl_{cr} <30 mL/minute: Avoid use

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain dosage adjustment guidelines. The following guidelines have been used by some clinicians (Floyd, 2006):

Bilirubin 3.1-5 mg/dL **or** transaminases >3 times ULN: Administer 75% of dose

Bilirubin >5 mg/dL: Avoid use

Dosing: Combination Regimens

Bladder cancer:

- CMV
- M-VAC (Bladder Cancer)

Breast cancer:

- CMF
- CMF-IV
- CMFP
- CMFVP (Cooper Regimen, VPCMF)
- Dox-CMF (Sequential)
- MF
- M-VAC (Breast Cancer)

Cervical cancer: M-VAC (Cervical Cancer)

Endometrial cancer: MVAC (Endometrial Cancer)

Gastric cancer: FAMTX

Gestational trophoblastic tumor:

CHAMOCA (Modified Bagshawe Regimen)

CHAMOMA (Bagshawe Regimen)

EMA/CO

EP/EMA

Head and neck cancer:

CABO

MVAC (Head and Neck)

Leukemia, acute lymphocytic:

Hyper-CVAD + Imatinib

Hyper-CVAD (Leukemia, Acute Lymphocytic)

Linker Protocol

MTX/6-MP/VP (Maintenance)

POMP

PVA (POG 8602)

Leukemia, acute promyelocytic:Tretinoin-Idarubicin

Lymphoma, Hodgkin's disease: COMP

Lymphoma, non-Hodgkin's:

COMLA

Hyper-CVAD (Lymphoma, non-Hodgkin's)

IMVP-16

MACOP-B

m-BACOD

Pro-MACE-CytaBOM

Lymphoma, non-Hodgkin's (Burkitt's): CODOX-M/IVAC

Lymphoma, non-Hodgkin's: (Mantle Cell): Hyper-CVAD + Rituximab

Osteosarcoma:

HDMTX

MTX-CDDPAdr

POG-8651

Soft tissue sarcoma: Methotrexate-Vinblastine (Desmoid Tumor)

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.May be administered I.M.

Administration: I.V.May be administered I.V.; I.V. administration may be as slow push, short bolus infusion, or 24- to 42-hour continuous infusion

Specific dosing schemes vary, but high dose should be followed by leucovorin calcium to prevent toxicity; refer to Leucovorin monograph

Administration: OtherMay be administered I.T or SubQ.

Dietary Considerations

Sodium content of 100 mg injection: 20 mg (0.86 mEq)

Sodium content of 100 mg (low sodium) injection: 15 mg (0.65 mEq)

StorageStore tablets and intact vials at room temperature (15°C to 25°C). Protect from light. Solution diluted in D_5W or NS is stable for 24 hours at room temperature (21°C to 25°C). Reconstituted solutions with a preservative may be stored under refrigeration for up to 3 months, and up to 4 weeks at room temperature. Intrathecal dilutions are stable at room temperature for 7 days, but it is generally recommended that they be used within 4-8 hours.

ReconstitutionDilute powder with D_5W or NS to a concentration ≤25 mg/mL (20 mg and 50 mg vials) and 50 mg/mL (1 g vial). Intrathecal solutions may be reconstituted to 2.5-5 mg/mL with NS, D_5W, lactated Ringer's, or Elliott's B solution. **Use preservative free preparations for intrathecal or high-dose administration.**

CompatibilityStable in D_5NS, D_5W, NS.

Y-site administration: Compatible: Allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, asparaginase, aztreonam, bleomycin, cefepime, ceftriaxone, cimetidine, cisplatin, cyclophosphamide, cytarabine, daunorubicin, dexchlorpheniramine, diphenhydramine, doxorubicin, doxorubicin liposome, etoposide, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, gatifloxacin, granisetron, heparin, hydromorphone, imipenem/cilastatin, leucovorin, linezolid, lorazepam, melphalan, mesna, methylprednisolone sodium succinate, metoclopramide, mitomycin, morphine, ondansetron, oxacillin, paclitaxel, piperacillin/tazobactam, prochlorperazine edisylate, ranitidine, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vindesine, vinorelbine. **Incompatible:** Chlorpromazine, gemcitabine, idarubicin, ifosfamide, midazolam, nalbuphine, promethazine, propofol. **Variable (consult detailed reference):** Dexamethasone sodium phosphate, droperidol, vancomycin.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, doxapram, doxorubicin, fluorouracil, furosemide, heparin, leucovorin, mitomycin, vinblastine, vincristine. **Incompatible:** Droperidol. **Variable (consult detailed reference):** Metoclopramide.

Compatibility when admixed: Compatible: Cyclophosphamide, cyclophosphamide with fluorouracil, cytarabine, dacarbazine, fluorouracil, hydrocortisone, hydroxyzine, mercaptopurine, ondansetron, sodium bicarbonate, vincristine. **Incompatible:** Bleomycin.

ContraindicationsHypersensitivity to methotrexate or any component of the formulation; severe renal or hepatic impairment; pre-existing profound bone marrow suppression in patients with psoriasis or rheumatoid arthritis, alcoholic liver disease, AIDS, pre-existing blood dyscrasias; pregnancy (in patients with psoriasis or rheumatoid arthritis); breast-feeding

Allergy Considerations

- Methotrexate/Trimetrexate Allergy

Warnings/Precautions

Boxed Warnings:

- Acute renal failure: See “Concerns related to adverse effects” below.
- Ascites/pleural effusion: See “Disease-related concerns” below.
- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Dermatologic reactions: See “Concerns related to adverse effects” below.
- Diarrhea/stomatitis: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hepatotoxicity: See “Concerns related to adverse effects” below.
- Lymphomas: See “Concerns related to adverse effects” below.
- NSAID's: See “Concurrent drug therapy issues” below.
- Opportunistic infections: See “Concerns related to adverse effects” below.
- Pneumonitis: See “Concerns related to adverse effects” below.
- Pregnancy: See “Special populations” below.
- Preservative containing formulations/diluents: See “Dosage form specific issues” below.
- Radiotherapy recipients: See “Special populations” below..
- Renal impairment: See “Disease-related concerns” below.
- Tumor lysis syndrome: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Acute renal failure: **[U.S. Boxed Warning]: May cause renal damage leading to acute renal failure, especially with high-dose methotrexate;** monitor renal function and methotrexate levels closely, maintain adequate hydration and urinary alkalinization. Use caution in osteosarcoma patients treated with high-dose methotrexate in combination with nephrotoxic chemotherapy (eg, cisplatin).
- Bone marrow suppression: **[U.S. Boxed Warning]: Bone marrow suppression may occur,** resulting in anemia, aplastic anemia, pancytopenia, leukopenia, neutropenia, and/or thrombocytopenia. Use caution in patients with pre-existing bone marrow suppression. Discontinue therapy in RA or psoriasis if a significant decrease in hematologic components is noted.

- Dermatologic reactions: **[U.S. Boxed Warning]: Any dose level or route of administration may cause severe and potentially fatal dermatologic reactions,** including toxic epidermal necrolysis, Stevens-Johnson syndrome, exfoliative dermatitis, skin necrosis, and erythema multiforme. Radiation dermatitis and sunburn may be precipitated by methotrexate administration. Psoriatic lesions may be worsened by concomitant exposure to ultraviolet radiation.

- Diarrhea/stomatitis: **[U.S. Boxed Warning]: Diarrhea and ulcerative stomatitis may require interruption of therapy;** death from hemorrhagic enteritis or intestinal perforation has been reported. Use with caution in patients with peptic ulcer disease, ulcerative colitis.

- Fertility: May cause impairment of fertility, oligospermia, and menstrual dysfunction.

- Hepatotoxicity: **[U.S. Boxed Warning]: Methotrexate has been associated with acute (elevated transaminases) and potentially fatal chronic (fibrosis, cirrhosis) hepatotoxicity.** Risk is related to cumulative dose and prolonged exposure. Monitor closely (with liver function tests, including serum albumin) for liver toxicities. Liver enzyme elevations may be noted, but may not be predictive of hepatic disease in long term treatment for psoriasis (but generally is predictive in rheumatoid arthritis [RA] treatment). With long-term use, liver biopsy may show histologic changes, fibrosis or cirrhosis; periodic liver biopsy is recommended with long-term use for psoriasis and for persistent abnormal liver function tests with RA; discontinue methotrexate with moderate-to-severe change in liver biopsy. Ethanol abuse, obesity, advanced age, and diabetes may increase the risk of hepatotoxic reactions. Use caution with preexisting liver impairment; may require dosage reduction. Use caution when used with other hepatotoxic agents (azathioprine, retinoids, sulfasalazine).

- Lymphomas: **[U.S. Boxed Warning]: Use of low dose methotrexate has been associated with the development of malignant lymphomas;** may regress upon discontinuation of therapy; treat lymphoma appropriately if regression is not induced by cessation of methotrexate.

- Neurotoxicity: May cause neurotoxicity including seizures (usually in pediatric ALL patients), leukoencephalopathy (usually with concurrent cranial irradiation) and stroke-like encephalopathy (usually with high-dose regimens). Chemical arachnoiditis (headache, back pain, nuchal rigidity, fever), myelopathy and chronic leukoencephalopathy may result from intrathecal administration.

- Opportunistic infections: **[U.S. Boxed Warning]: Immune suppression may lead to potentially fatal opportunistic infections.**

- Pneumonitis: **[U.S. Boxed Warning]: May cause potentially life-threatening pneumonitis** (may occur at any time during therapy and at any dosage); monitor closely for pulmonary symptoms, particularly dry, nonproductive cough. Other potential symptoms include fever, dyspnea, hypoxemia, or pulmonary infiltrate.

- Tumor lysis syndrome: **[U.S. Boxed Warning]: Tumor lysis syndrome may occur in patients with high tumor burden;** use appropriate prevention and treatment.

Disease-related concerns:

- Ascites/pleural effusions: **[U.S. Boxed Warning]: Elimination is reduced in patients with ascites and/or pleural fluid;** may require dose reduction or discontinuation. Monitor closely for toxicity.

- Hepatic impairment: Use with caution in patients with pre-existing liver impairment.

- Peptic ulcer disease: Use with caution in patients with peptic ulcer disease; diarrhea and stomatitis may occur.

- Renal impairment: **[U.S. Boxed Warning]: Methotrexate elimination is reduced in patients with renal impairment;** may require dose reduction or discontinuation; monitor closely for toxicity.

- Ulcerative colitis: Use with caution in patients with ulcerative colitis; diarrhea and stomatitis may occur.

Concurrent drug therapy issues:

- Hepatotoxic agents: Use caution when used with other hepatotoxic agents (azathioprine, retinoids, sulfasalazine).

- Nephrotoxic chemotherapy: Use caution in osteosarcoma patients treated with high-dose methotrexate in combination with nephrotoxic chemotherapy (eg, cisplatin).

- NSAID's: **[U.S. Boxed Warning]: Concurrent administration with NSAIDs may cause severe bone marrow suppression, aplastic anemia, and GI toxicity.** Do not administer NSAIDs prior to or during high dose methotrexate therapy; may increase and prolong serum methotrexate levels. Doses used for psoriasis may still lead to unexpected toxicities; use caution when administering NSAIDs or salicylates with lower doses of methotrexate for RA. Methotrexate may increase the levels and effects of mercaptopurine; may require dosage adjustments. Vitamins containing folate may decrease response to systemic methotrexate; folate deficiency may increase methotrexate toxicity.

Special populations:

- Elderly: Use caution in the elderly; increased risk of toxicity.

- Pregnancy: **[U.S. Boxed Warning]: May cause fetal death or congenital abnormalities; do not use for psoriasis or RA treatment in pregnant women.**

- Radiotherapy recipients: **[U.S. Boxed Warning]: Concomitant methotrexate administration with radiotherapy may increase the risk of soft tissue necrosis and osteonecrosis.**

Dosage form specific issues:

- Benzyl alcohol: Injection may contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

- Preservative containing formulations/diluents: **[U.S. Boxed Warnings]: Methotrexate formulations and/or diluents containing preservatives should not be used for intrathecal or high-dose therapy.**

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warnings]: Should be administered under the supervision of a physician experienced in the use of antimetabolite therapy;** serious and fatal toxicities have occurred at all dose levels. For rheumatoid arthritis and psoriasis, immunosuppressive therapy should only be used when disease is active and less toxic, traditional therapy is ineffective.

Geriatric ConsiderationsToxicity to methotrexate or any immunosuppressive is increased in the elderly. Must monitor carefully. For rheumatoid arthritis and psoriasis, immunosuppressive therapy should only be used when disease is active and less toxic, traditional therapy is ineffective. Recommended doses should be reduced when initiating therapy in the elderly due to possible decreased metabolism, reduced renal function, and presence of interacting diseases and drugs. Adjust dose as needed for renal function (Cl_{cr}).

Pregnancy Risk FactorX (psoriasis, rheumatoid arthritis)

Pregnancy Considerations**[U.S. Boxed Warning]: May cause fetal death or congenital abnormalities; do not use for psoriasis or RA treatment in pregnant women.** Use for the treatment of neoplastic diseases only when the potential benefit to the mother outweighs the possible risk to the fetus. Pregnancy should be excluded prior to therapy in women of childbearing potential. Pregnancy should be avoided for ≥3 months following treatment in male patients and ≥1 ovulatory cycle in female patients.

LactationEnters breast milk/contraindicated

Adverse Reactions**Note:** Adverse reactions vary by route and dosage. Hematologic and/or gastrointestinal toxicities may be common at dosages used in chemotherapy; these reactions are much less frequent when used at typical dosages for rheumatic diseases.

>10%:

- Central nervous system (with I.T. administration or very high-dose therapy):
  - Arachnoiditis: Acute reaction manifested as severe headache, nuchal rigidity, vomiting, and fever; may be alleviated by reducing the dose
  - Subacute toxicity: 10% of patients treated with 12-15 mg/m^2 of I.T. methotrexate may develop this in the second or third week of therapy; consists of motor paralysis of extremities, cranial nerve palsy, seizure, or coma. This has also been seen in pediatric cases receiving very high-dose I.V. methotrexate.
  - Demyelinating encephalopathy: Seen months or years after receiving methotrexate; usually in association with cranial irradiation or other systemic chemotherapy
- Dermatologic: Reddening of skin
- Endocrine & metabolic: Hyperuricemia, defective oogenesis or spermatogenesis
- Gastrointestinal: Ulcerative stomatitis, glossitis, gingivitis, nausea, vomiting, diarrhea, anorexia, intestinal perforation, mucositis (dose dependent; appears in 3-7 days after therapy, resolving within 2 weeks)
- Hematologic: Leukopenia, thrombocytopenia
- Renal: Renal failure, azotemia, nephropathy
- Respiratory: Pharyngitis

1% to 10%:

- Cardiovascular: Vasculitis
- Central nervous system: Dizziness, malaise, encephalopathy, seizure, fever, chills
- Dermatologic: Alopecia, rash, photosensitivity, depigmentation or hyperpigmentation of skin
- Endocrine & metabolic: Diabetes
- Genitourinary: Cystitis
- Hematologic: Hemorrhage
- Myelosuppressive: This is the primary dose-limiting factor (along with mucositis) of methotrexate; occurs about 5-7 days after methotrexate therapy, and should resolve within 2 weeks
  - WBC: Mild
  - Platelets: Moderate
  - Onset: 7 days
  - Nadir: 10 days
  - Recovery: 21 days
- Hepatic: Cirrhosis and portal fibrosis have been associated with chronic methotrexate therapy; acute elevation of liver enzymes are common after high-dose methotrexate, and usually resolve within 10 days.
- Neuromuscular & skeletal: Arthralgia
- Ocular: Blurred vision
- Renal: Renal dysfunction: Manifested by an abrupt rise in serum creatinine and BUN and a fall in urine output; more common with high-dose methotrexate, and may be due to precipitation of the drug.
- Respiratory: Pneumonitis: Associated with fever, cough, and interstitial pulmonary infiltrates; treatment is to withhold methotrexate during the acute reaction; interstitial pneumonitis has been reported to occur with an incidence of 1% in patients with RA (dose 7.5-15 mg/week)

<1% (Limited to important or life-threatening): Acute neurologic syndrome (at high dosages - symptoms include confusion, hemiparesis, transient blindness, and coma); anaphylaxis, alveolitis, cognitive dysfunction (has been reported at low dosage), decreased resistance to infection, erythema multiforme, hepatic failure, leukoencephalopathy (especially following craniospinal irradiation or repeated high-dose therapy), lymphoproliferative disorders, osteonecrosis and soft tissue necrosis (with radiotherapy), pericarditis, plaque erosions (psoriasis), seizure (more frequent in pediatric patients with ALL), Stevens-Johnson syndrome, thromboembolism

Oncology: VesicantNo

Oncology: Emetic Potential

Low (10% to 30%): <250 mg/m^2

Moderate (30% to 90%): ≥250 mg/m^2

Methotrexate (oral): Very low (<10%)

Drug Interactions

Acitretin: May enhance the hepatotoxic effect of Methotrexate. *Risk X: Avoid combination*

Bile Acid Sequestrants: May decrease the absorption of Methotrexate. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Ciprofloxacin: May increase the serum concentration of Methotrexate. *Risk C: Monitor therapy*

CycloSPORINE: Methotrexate may increase the serum concentration of CycloSPORINE. This may result in nephrotoxicity. CycloSPORINE may increase the serum concentration of Methotrexate. This may result in nausea, vomiting, oral ulcers, hepatotoxicity and/or nephrotoxicity. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Leflunomide: Methotrexate may enhance the myelosuppressive effect of Leflunomide. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Penicillins: May decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Proton Pump Inhibitors: May decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Salicylates: May increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Sapropterin: Methotrexate may decrease the serum concentration of Sapropterin. Specifically, methotrexate may decrease tissue concentrations of tetrahydrobiopterin. *Risk C: Monitor therapy*

Sulfonamide Derivatives: May enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Trimethoprim: May enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may be associated with increased liver injury).

Food: Methotrexate peak serum levels may be decreased if taken with food. Milk-rich foods may decrease methotrexate absorption. Folate may decrease drug response.

Herb/Nutraceutical: Avoid echinacea (has immunostimulant properties).

Monitoring ParametersFor prolonged use (especially rheumatoid arthritis, psoriasis) a baseline liver biopsy, repeated at each 1-1.5 g cumulative dose interval, should be performed; WBC and platelet counts every 4 weeks; CBC and creatinine, LFTs every 3-4 months; chest x-ray

Reference RangeTherapeutic levels: Variable; Toxic concentration: Variable; therapeutic range is dependent upon therapeutic approach.

High-dose regimens produce drug levels that are between 0.1-1 micromole/L 24-72 hours after drug infusion

Toxic: Low-dose therapy: >0.2 micromole/L; high-dose therapy: >1 micromole/L

Nursing: Physical Assessment/MonitoringMonitor closely if used in presence of preexisting conditions that increase potential for toxicity (eg, renal impairment, peptic ulcer disease, ulcerative colitis, hepatic impairment, bone marrow suppression). Assess potential for interactions with other pharmacological agents and herbal products patient may be using (eg, NSAIDs and salicylates or other hepatotoxic agents, or drugs that may effect the levels/effects of methotrexate). Evaluate results of laboratory tests prior to therapy and at frequent intervals during therapy. Patient should be monitored closely for adverse reactions (eg, hyper- or hypothyroidism, pneumonitis [dry, nonproductive cough], gastrointestinal disturbance [ulcerative stomatitis, pain, intestinal perforation], renal failure [decreased urine output]). Assess effectiveness at regular intervals (according to purpose for use). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Instruct patient of childbearing age (or males who may have intercourse with women of childbearing age) in appropriate use of contraceptive measures during therapy and for 3 months following treatment of males or 1 ovulatory cycle in females.

Monitoring: Lab TestsFor prolonged use (especially rheumatoid arthritis, psoriasis) a baseline liver biopsy, repeated at each 1-1.5 g cumulative dose interval, should be performed; WBC and platelet counts every 4 weeks; CBC and creatinine, LFTs every 3-4 months; chest x-ray

Patient EducationDo not take any new medication during therapy unless approved by prescriber. **Infusion/injection:** Report immediately any redness, swelling, pain, or burning at infusion/injection site. It is very important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition (small frequent meals may help). Avoid alcohol to prevent serious side effects. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause sensitivity to sunlight (use sunscreen, wear protective clothing, and eyewear); nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help; if unresolved, contact prescriber); drowsiness, dizziness, numbness, or blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known); loss of hair (may be reversible); color change of skin; permanent sterility; or mouth sores (frequent mouth care with soft toothbrush or cotton swabs and frequent rinses may help). Report immediately any rash, excessive or unusual fatigue, or respiratory difficulty. Report rapid heartbeat or palpitations, black or tarry stools, fever, chills, unusual bleeding or bruising, shortness of breath, persistent GI disturbances, diarrhea, constipation, pain on urination or change in urinary patterns, or any other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. This drug may cause birth defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]: 20 mg, 1 g

Injection, solution: 25 mg/mL (2 mL, 10 mL) [contains benzyl alcohol]

Injection, solution [preservative free]: 25 mg/mL (2 mL, 4 mL, 8 mL, 10 mL, 40 mL)

Tablet: 2.5 mg

Trexall™: 5 mg, 7.5 mg, 10 mg, 15 mg

Tablet, as sodium [dose pack] (Rheumatrex® Dose Pack): 2.5 mg (4 cards with 2, 3, 4, 5, or 6 tablets each)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Methotrexate Sodium)

25 mg/mL (2): $8.99

25 mg/mL (2): $14.99

25 mg/mL (10): $24.99

25 mg/mL (40): $58.99

Tablets (Trexall)

10 mg (30): $426.29

Mechanism of ActionMethotrexate is a folate antimetabolite that inhibits DNA synthesis. Methotrexate irreversibly binds to dihydrofolate reductase, inhibiting the formation of reduced folates, and thymidylate synthetase, resulting in inhibition of purine and thymidylic acid synthesis. Methotrexate is cell cycle specific for the S phase of the cycle.

The MOA in the treatment of rheumatoid arthritis is unknown, but may affect immune function. In psoriasis, methotrexate is thought to target rapidly proliferating epithelial cells in the skin.

In Crohn's disease, it may have immune modulator and anti-inflammatory activity.

Pharmacodynamics/Kinetics

Onset of action: Antirheumatic: 3-6 weeks; additional improvement may continue longer than 12 weeks

Absorption: Oral: Rapid; well absorbed at low doses (<30 mg/m^2), incomplete after large doses; I.M.: Complete

Distribution: Penetrates slowly into 3rd space fluids (eg, pleural effusions, ascites), exits slowly from these compartments (slower than from plasma); crosses placenta; small amounts enter breast milk; sustained concentrations retained in kidney and liver

Protein binding: 50%

Metabolism: <10%; degraded by intestinal flora to DAMPA by carboxypeptidase; hepatic aldehyde oxidase converts methotrexate to 7-OH methotrexate; polyglutamates are produced intracellularly and are just as potent as methotrexate; their production is dose- and duration-dependent and they are slowly eliminated by the cell once formed

Half-life elimination: Low dose: 3-10 hours; High dose: 8-12 hours

Time to peak, serum: Oral: 1-2 hours; I.M.: 30-60 minutes

Excretion: Urine (44% to 100%); feces (small amounts)

- Safe Handling of Hazardous Drugs

Pharmacotherapy Pearls**Latex-free products:** 50 mg/2 mL, 100 mg/4 mL, and 250 mg/10 mL vials with and without preservatives by Immunex

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Ulcerative stomatitis, gingivitis, glossitis, and mucositis (dose dependent; appears 3-7 days post-therapy and resolves within 2 weeks). Dental professionals should note before prescribing NSAIDS that concurrent administration with methotrexate may cause severe bone marrow suppression, aplastic anemia, and GI toxicity (see Warnings). Although the risk is lower at the methotrexate dosages used for rheumatoid conditions/psoriasis, the addition of an NSAID or salicylate may still lead to unexpected toxicities; caution is warranted.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; avoid clozapine and carbamazepine

Index TermsAmethopterin; Methotrexate Sodium; MTX (error-prone abbreviation) ; NSC-740

Methotrimeprazine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(meth oh trye MEP ra zeen)

Canadian Brand NamesApo-Methoprazine®; Novo-Meprazine; Nozinan®; PMS-Methotrimeprazine

Pharmacologic CategoryAnalgesic, Nonopioid

Use: Labeled IndicationsTreatment of schizophrenia or psychosis; management of pain, including pain caused by neuralgia or cancer; adjunct to general anesthesia; management of nausea and vomiting; sedation

Use: Unlabeled/InvestigationalBipolar disorder, agitation

Dosing: Adults

Anxiety, mild-moderate pain: Oral: 6-25 mg/day in 3 divided doses

Psychoses, severe pain: Oral: 50-75 mg/day in 2-3 divided doses; titrate to effect (doses up to 1000 mg/day or greater have been used in treatment of some patients with psychoses). If higher dosages are used to initiate therapy (100-200 mg/day), patients should be restricted to bed for the first few days of therapy.

Sedative: Oral: 10-25 mg at bedtime

Psychoses, severe pain: I.M.: 75-100 mg (administered in 3-4 deep I.M. injections)

Analgesia (postoperative): I.M.: 10-25 mg every 8 hours (2.5-7.5 mg every 4-6 hours is suggested postoperatively if residual effects of anesthetic may be present)

Premedication: I.M.: 10-25 mg every 8 hours (final preoperative dose may be 25-50 mg administered ~1 hour prior to surgery)

During surgical procedures/labor: I.V.: 20-50 mcg/minute (some patients may require up to 100 mcg/minute)

Palliative care: SubQ (continuous infusion): 25-200 mg/day (via syringe driver)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of psychosis: Children >2 years:

Oral: 0.25 mg/kg/day in 2-3 divided doses; may increase gradually based on response.

Maximum dose: 40 mg/day in children <12 years

I.M.: 0.06-0.125 mg/kg/day in 1-3 divided doses

Dosing: Renal ImpairmentAdminister cautiously although no specific guidelines are available.

Dosing: Hepatic ImpairmentAdminister cautiously although no specific guidelines are available

StorageInjection: Protect from light.

Compatibility**Compatible:** Stable in NS; **incompatible** with alkaline solutions.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to methotrimeprazine, phenothiazines, or any component of the formulation; severe cardiac or hepatic disease; hematologic disorders (blood dyscrasia); history of convulsive disorders; severe CNS depression or coma; concurrent use of MAO inhibitors

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines.

- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); therefore, they should be used with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems. Conditions which also may be exacerbated by cholinergic blockade include narrow-angle glaucoma (screening is recommended) and myasthenia gravis.

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Extrapyramidal symptoms: May cause extrapyramidal symptoms and/or tardive dyskinesia.

- Neuroleptic malignant syndrome (NMS): May be associated with NMS.
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of hypotension or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Hypotension may occur following administration, particularly when parenteral form is used or in high dosages.
- Temperature regulation: May alter temperature regulation.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression.
- Cardiac disease: Use with caution in patients with severe cardiac disease.
- Hemodynamic instability: Use with caution in patients who are hemodynamically unstable.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Parkinson's disease: Use with caution in patients with Parkinson's disease.
- Prolactin-dependent tumors: Use with caution in breast cancer or other prolactin-dependent tumors (may elevate prolactin levels).
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.
- Seizure disorder: Use with caution in patients with a predisposition to seizures.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Other warnings/precautions:

- Antiemetic effects: May mask toxicity of other drugs due to antiemetic effects.

Pregnancy Risk FactorC
Adverse Reactions**Note:** Frequencies not defined; some reactions listed are based on reports for other agents in this same pharmacologic class, and may not be specifically reported for methotrimeprazine.

Cardiovascular: Hypotension, orthostatic hypotension, tachycardia, QT_c prolongation (rare)

Central nervous system: Extrapyramidal symptoms (pseudoparkinsonism, akathisia, dystonias, tardive dyskinesia), dizziness, seizure, headache, drowsiness, neuroleptic malignant syndrome (NMS), impairment of temperature regulation

Dermatologic: Photosensitivity (rare), rash

Endocrine & metabolic: Gynecomastia, weight gain, menstrual irregularity, libido (changes in)

Gastrointestinal: Constipation, vomiting, nausea, xerostomia, ileus

Genitourinary: Difficulty in urination, ejaculatory disturbances, incontinence, polyuria, ejaculating dysfunction, priapism

Hematologic: Agranulocytosis (rare), leukopenia, eosinophilia, hemolytic anemia, thrombocytopenic purpura, pancytopenia

Hepatic: Cholestatic jaundice, hepatotoxicity

Miscellaneous: Diaphoresis

Metabolism/Transport Effects**Inhibits** CYP2D6
Drug Interactions**Inhibits** CYP2D6 (moderate)

Acetylcholinesterase inhibitors (central): May increase the risk of antipsychotic-related extrapyramidal symptoms; monitor.

Aluminum salts: May decrease the absorption of phenothiazines; monitor.

Amphetamines: Efficacy may be diminished by antipsychotics; in addition, amphetamines may increase psychotic symptoms; avoid concurrent use.

Anticholinergics: May inhibit the therapeutic response to phenothiazines and excess anticholinergic effects may occur; includes benztropine, trihexyphenidyl, biperiden, and drugs with significant anticholinergic activity (TCAs, antihistamines, disopyramide).

Antihypertensives: Concurrent use of phenothiazines with an antihypertensive may produce additive hypotensive effects (particularly orthostasis).

Bromocriptine: Phenothiazines inhibit the ability of bromocriptine to lower serum prolactin concentrations.

CNS depressants: Sedative effects may be additive with phenothiazines. If a patient is receiving methotrimeprazine, the dose of a barbiturate or narcotic should be reduced by 50%. Monitor for increased effects of benzodiazepines, ethanol and other sedative agents.

CYP2D6 substrates: Methotrimeprazine may increase the levels/effects of CYP2D6 substrates. Example substrates include amphetamines, selected beta-blockers, dextromethorphan, fluoxetine, lidocaine, mirtazapine, nefazodone, paroxetine, risperidone, ritonavir, thioridazine, tricyclic antidepressants, and venlafaxine.

CYP2D6 prodrug substrates: Methotrimeprazine may decrease the levels/effects of CYP2D6 prodrug substrates. Example prodrug substrates include codeine, hydrocodone, oxycodone, and tramadol.

Epinephrine: Low potency antipsychotics may diminish the pressor effects of epinephrine.

Guanethidine and guanadrel: Antihypertensive effects may be inhibited by phenothiazines.

Levodopa: Phenothiazines may inhibit the antiparkinsonian effect of levodopa; avoid this combination.

Lithium: Phenothiazines may produce neurotoxicity with lithium; this is a rare effect.

MAO inhibitors: Concurrent use of MAO inhibitors may result in toxicity; these combinations are best avoided.

Metoclopramide: May increase extrapyramidal symptoms (EPS) or risk.

Phenytoin: May reduce serum levels of phenothiazines; phenothiazines may increase phenytoin serum levels.

Polypeptide antibiotics: Rare cases of respiratory paralysis have been reported with concurrent use of phenothiazines.

Propranolol: Serum concentrations of phenothiazines may be increased; propranolol also increases phenothiazine concentrations.

Sulfadoxine-pyrimethamine: May increase phenothiazine concentrations.

Trazodone: Phenothiazines and trazodone may produce additive hypotensive effects.

Tricyclic antidepressants: Concurrent use may produce increased toxicity or altered therapeutic response.

Valproic acid: Serum levels may be increased by phenothiazines.

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Limit caffeine.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersLiver function should be obtained at baseline and every 2-3 months during therapy.
Monitoring: Lab TestsLiver function should be obtained at baseline and every 2-3 months during therapy.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 25 mg/mL (1 mL)

Solution, oral: 5 mg/mL (500 mL) [contains ethanol 2%]

Solution, oral drops: 40 mg/mL (100 mL) [contains ethanol 16.5%]

Tablet, as maleate: 2 mg, 5 mg, 25 mg, 50 mg

Generic AvailableNo
Mechanism of ActionDopamine antagonist; also binds alpha-1, alpha-2, and serotonin receptors
Pharmacodynamics/Kinetics

Onset of action: Injection: 1 hour

Duration: 2-4 hours

Bioavailability: 50%

Time to peak, serum: I.M.: 0.5-1.5 hours; Oral: 1-3 hours

Half-life elimination: 30 hours

Pharmacotherapy PearlsNot available in U.S.
Dental Health Professional ConsiderationsThis drug is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Methotrimeprazine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged

QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease). Phenothiazines can cause extrapyramidal reactions which may appear as muscle twitching or increased motor activity of the face, neck, or head.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions (see Dental Comment)

Mental Health: Effects on Mental StatusIs a phenothiazine; dizziness and extrapyramidal symptoms are common; may rarely cause neuroleptic malignant syndrome

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors and patient with hypersensitivity to phenothiazines; may rarely cause agranulocytosis; use caution with clozapine and carbamazepine

Index TermsLevomepromazine; Methotrimeprazine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Methoxsalen soft gelatin capsules (Oxsoralen-Ultra®) may be confused with methoxsalen hard gelatin capsules (8-MOP®, Oxsoralen®); bioavailability and photosensitization onset differ between the two products.

Pronunciation(meth OKS a len)

U.S. Brand Names8-MOP®; Oxsoralen-Ultra®; Oxsoralen®; Uvadex®

Canadian Brand NamesOxsoralen-Ultra®; Oxsoralen®; Ultramop™; Uvadex®

Pharmacologic CategoryPsoralen

Use: Labeled Indications

Oral: Symptomatic control of severe, recalcitrant disabling psoriasis; repigmentation of idiopathic vitiligo; palliative treatment of skin manifestations of cutaneous T-cell lymphoma (CTCL)

Topical: Repigmentation of idiopathic vitiligo

Extracorporeal: Palliative treatment of skin manifestations of CTCL

Dosing: Adults**Note:** Refer to treatment protocols for UVA exposure guidelines.

Psoriasis: Oral:

Initial: 10-70 mg 1.5-2 hours (Oxsoralen-Ultra®) or 2 hours (8-MOP®) before exposure to UVA light; dose may be repeated 2-3 times per week, based on UVA exposure; doses must be given at least 48 hours apart; dosage is based upon patient's body weight and skin type:

<30 kg: 10 mg

30-50 kg: 20 mg

51-65 kg: 30 mg

66-80 kg: 40 mg

81-90 kg: 50 mg

91-115 kg: 60 mg

>115 kg: 70 mg

Note: Dosage may be increased (one time) by 10 mg after 15th treatment if minimal or no response.

Maintenance: When 95% psoriasis clearing achieved, may begin 1 treatment every week for at least 2 treatments; followed by 1 treatment every 2 weeks for at least 2 treatments; then every 3 weeks for at least 2 treatments then as needed to maintain response while minimizing UVA exposure.

Vitiligo:

Oral (8-MOP®): 20 mg 2-4 hours before exposure to UVA light; dose may be repeated based on erythema and tenderness of skin; do not give on 2 consecutive days

Topical (Oxsoralen®): Lotion is applied prior to UVA light exposure, usually no more than once weekly

CTCL: Extracorporeal (Uvadex®): 200 mcg injected into the photoactivation bag during the collection cycle using the UVAR® photopheresis system (consult user's guide). Treatment schedule: Two consecutive days every 4 weeks for a minimum of 7 treatment cycles, may accelerate to two consecutive days every 2 weeks if skin score worsens (eg, increases from baseline) after assessment during the fourth treatment cycle. If skin score improves by 25% after 4 consecutive weeks of accelerated therapy, may resume regular treatment schedule. Maximum: 20 accelerated therapy cycles.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricVitiligo: Topical: Children >12 years: Refer to adult dosing.

Administration: TopicalHands and fingers of person applying the lotion should be protected to prevent possible photosensitization and/or burns.

Dietary ConsiderationsTo reduce nausea, oral drug can be administered with food or milk or in 2 divided doses 30 minutes apart.

ContraindicationsHypersensitivity to methoxsalen (psoralens) or any component of the formulation; diseases associated with photosensitivity (eg, albinism, lupus erythematosus, porphyria [cutanea tarda, erythropoietic and variegate], xeroderma pigmentosum); invasive squamous cell cancer; aphakia; melanoma or history of melanoma; children <12 years of age (Oxsoralen® lotion)

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Product interchange: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- Burns: Serious burns may occur from ultraviolet radiation or sunlight (even if exposed through glass) if recommended dose and/or exposure schedule is not maintained.
- Cataracts: Methoxsalen concentrates in the lens; eyes should be shielded from direct and indirect sunlight for 24 hours to prevent possible formation of cataracts.
- Photosensitivity: Avoid sun (including sun lamp) exposure for 8 hours after methoxsalen ingestion. Protective clothing, eyewear, and sunscreen (do not apply sunscreen to psoriatic areas) should be used for 24 hours after combined methoxsalen/UVA therapy. Do not use in sunburned patients until they have fully recovered; pre-existing sunburn may obscure evaluation of response; advise patients to avoid sunbathing for 24 hours prior to treatment and for 48 hours after treatment. Use extreme caution in patients who have significant exposure to the sun through their occupation.
- Skin cancer: Therapy may lead to increased risk of skin cancer (basal cell, melanoma and squamous cell); this risk may be increased with fair skin or prior exposure to prolonged tar and UVB treatment, ionizing radiation, or arsenic.

Disease-related concerns:

- Basal cell carcinoma: Use with caution in patients with multiple basal cell carcinomas or a history of basal cell carcinoma; observe closely.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (may not be able to tolerate the heat stress or prolonged standing related to UVA treatment conditions).
- CTCL: Appropriate use: For use only if inadequate response to other forms of therapy. Used in conjunction with long wave radiation of white blood cells using the UVAR® photopheresis system.
- Hepatic impairment: Methoxsalen undergoes hepatic metabolism; use with caution in patients with hepatic impairment.
- Psoriasis: Appropriate use: For use only if inadequate response to other therapies when the diagnosis is biopsy proven. Administer only in conjunction with scheduled controlled doses of long wave ultraviolet (UVA) radiation (combination referred to as PUVA).
- Vitiligo: Appropriate use: Used in conjunction with controlled doses of long wave ultraviolet radiation or sunlight. Lotion should only be applied under direct supervision of prescriber and should not be dispensed to the patient.

Concurrent drug therapy issues:

- Photosensitizing agents: Use caution with other (systemic or topical) photosensitizing drugs (eg, thiazides, tetracyclines, fluoroquinolones, phenothiazines, sulfonamides, anthralin, coal tar preparations).

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children for CTCL or psoriasis and <12 years of age for vitiligo. The long-term effects of treatment (including potential cataract formation, skin cancer development, and premature skin aging) are unknown in children.

Dosage form specific issues:

- Product interchange: **[U.S. Boxed Warning]: Soft-gelatin capsule (Oxsoralen-Ultra®) and hard-gelatin capsule (8-MOP®, Oxsoralen®) are not interchangeable; retitration is required if the formulation is changed.** Oxsoralen-Ultra® has a greater bioavailability and shorter onset of photosensitization.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced physician with special competence in the diagnosis and treatment of dermatologic diseases.**

Pregnancy Risk FactorC/D (Uvadex®)

Pregnancy ConsiderationsFetal toxicity has been observed in animal studies, however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy is not recommended. Women of childbearing potential should be advised to avoid pregnancy.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not always defined.

Cardiovascular: Edema, hypotension

Central nervous system: Depression, dizziness, headache, insomnia, malaise, nervousness, vertigo

Dermatologic: Pruritus (10%), blistering (painful), bullae formation, burning, erythema, folliculitis, freckling, hypopigmentation, miliaria, peeling of skin, premature aging, rash, skin cancer, tenderness (cutaneous), urticaria, vesiculation

Gastrointestinal: Nausea (10%), gastrointestinal disturbance

Neuromuscular & skeletal: Loss of muscle coordination, leg cramps

Ocular: Cataract

Miscellaneous: Herpes simplex, infection

Metabolism/Transport Effects**Substrate** of CYP2A6 (minor); **Inhibits** CYP1A2 (strong), 2A6 (strong), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2A6 Substrates: CYP2A6 Inhibitors (Strong) may decrease the metabolism of CYP2A6 Substrates. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Methoxsalen serum concentrations may be increased if taken with food. Avoid furocoumarin-containing foods (limes, figs, parsley, celery, cloves, lemon, mustard, carrots).

Monitoring ParametersCBC with differential (baseline and every 6-12 months), liver and renal function tests (baseline and every 6-12 months), antinuclear antibodies (baseline and every 6-12 months); ophthalmic exam (pretreatment and yearly)

Nursing: Physical Assessment/Monitoring**Note:** This drug is administered in conjunction with ultraviolet light or ultraviolet radiation therapy. Teach patient proper use, side effects/appropriate interventions (eg, sunlight precautions), and adverse reactions to report.

Monitoring: Lab TestsCBC with differential (baseline and every 6-12 months), liver and renal function tests (baseline and every 6-12 months), antinuclear antibodies (baseline and every 6-12 months)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used in conjunction with specific ultraviolet treatment. Take as directed, with food or milk to reduce nausea. Consult prescriber for specific dietary instructions. Avoid use of any other skin treatments unless approved by prescriber. Control exposure to direct sunlight as per prescriber's instructions. If sunlight cannot be avoided, use sunblock (consult prescriber for specific SPF level); wear protective clothing and wraparound protective eyewear. Consult prescriber immediately if burning, blistering, or skin irritation occur. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

8-MOP®: 10 mg [hard-gelatin capsule]

Oxsoralen-Ultra®: 10 mg [soft-gelatin capsule]

Lotion (Oxsoralen®): 1% (30 mL) [contains alcohol 71%]

Solution, for extracorporeal administration (Uvadex®): 20 mcg/mL (10 mL) **[not for injection]**

Generic AvailableNo

ManufacturerICN Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Capsules (8-Mop)

10 mg (50): $1145.73

Capsules (Oxsoralen Ultra)

10 mg (30): $680.36

Mechanism of ActionBonds covalently to pyrimidine bases in DNA, inhibits the synthesis of DNA, and suppresses cell division. The augmented sunburn reaction involves excitation of the methoxsalen molecule by radiation in the long-wave ultraviolet light (UVA), resulting in transference of energy to the methoxsalen molecule producing an excited state (“triplet electronic state”). The molecule, in this “triplet state”, then reacts with cutaneous DNA.

Pharmacodynamics/Kinetics

Protein binding: Reversibly bound to albumin

Metabolism: Hepatic; forms metabolites

Bioavailability: Bioavailability increased with soft-gelatin capsules (Oxsoralen-Ultra®) compared to hard-gelatin capsules (8-MOP®, Oxsoralen®); exposure using Uvadex® with the UVAR® photopheresis system is ~200 times less than with oral methoxsalen administration

Time to peak, serum:

Hard-gelatin capsules (8-MOP®, Oxsoralen®): 1.5-6 hours (peak photosensitivity: ~4 hours)

Soft-gelatin capsules (Oxsoralen-Ultra®): 0.5-4 hours (peak photosensitivity: 1.5-2 hours)

Half-life elimination: ~2 hours

Excretion: Urine (~95% as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness, dizziness, or depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive photosensitivity

Methscopolamine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

International issues:

> Pamine® may be confused with Pemine® which is a brand name for penicillamine in Italy

Pronunciation(meth skoe POL a meen)
U.S. Brand NamesPamine®; Pamine® Forte
Canadian Brand NamesPamine®
Pharmacologic CategoryAnticholinergic Agent
Use: Labeled IndicationsAdjunctive therapy in the treatment of peptic ulcer
Dosing: Adults**Peptic ulcer (adjunctive):** Oral: 2.5 mg 30 minutes before meals or food and 2.5-5 mg at bedtime; may increase dose to 5 mg twice daily
Dosing: ElderlyRefer to adult dosing.
Administration: OralAdminister 30 minutes before meals or food.
Dietary ConsiderationsShould be taken 30 minutes before meals or food.
ContraindicationsHypersensitivity to methscopolamine, any component of the formulation, or related drugs; reflux esophagitis; glaucoma; obstructed uropathy; obstructed disease of the GI tract (pyloroduodenal stenosis); paralytic ileus; intestinal atony of elderly or debilitated individuals; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon; complicated ulcerative colitis; myasthenia gravis
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Diarrhea: May be a sign of incomplete intestinal obstruction, treatment should be discontinued if this occurs.
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia.
- Renal impairment: Use with caution in patients with renal impairment.
- Ulcerative colitis: Use with caution in patients with ulcerative colitis; may precipitate/aggravate toxic megacolon.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for anticholinergic effects, confusion, and hallucinations.
- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Methscopolamine is a derivative of scopolamine. Scopolamine is reported to cross the placenta; fetal toxicity noted in case reports.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsAnticholinergics may suppress lactation. The AAP considers atropine and scopolamine to be “compatible” with breast-feeding.
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia

Central nervous system: Headache, insomnia, flushing, nervousness, drowsiness, dizziness, confusion, fever, CNS stimulation may be produced with large doses

Dermatologic: Dry skin, urticaria

Endocrine & metabolic: Lactation suppressed

Gastrointestinal: Constipation, xerostomia, dry throat, dysphagia, nausea, vomiting, loss of taste

Genitourinary: Impotence, urinary hesitancy, urinary retention

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, cycloplegia, ocular tension increased, pupil dilation

Respiratory: Dry nose

Miscellaneous: Allergic reaction, diaphoresis decreased, hypersensitivity reactions, anaphylaxis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as bromide: 2.5 mg, 5 mg

Pamine®: 2.5 mg [lactose free]

Pamine® Forte: 5 mg [lactose free; dosepak]

Generic Available

Yes

Pricing: U.S. (www.drugstore.com)

Tablets (Methscopolamine Bromide)

2.5 mg (100): $149.98

5 mg (60): $117.99

Tablets (Pamine)

2.5 mg (120): $237.59

Tablets (Pamine Forte)

5 mg (60): $189.64

Mechanism of Action

Methscopolamine is a peripheral anticholinergic agent with limited ability to cross the blood-brain barrier and provides a peripheral blockade of muscarinic receptors. This agent reduces the volume and the total acid content of gastric secretions, inhibits salivation, and reduces gastrointestinal motility.

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Duration: 4-6 hours

Excretion: Bile, urine

Dental Health: Effects on Dental Treatment

Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and dry throat and nose. Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

No information available to require special precautions

Mental Health: Effects on Mental Status

May rarely cause drowsiness, confusion, amnesia, or nervousness

Mental Health: Effects on Psychiatric Treatment

Concurrent use with psychotropics may produce additive sedation and dry mouth

Index Terms

Methscopolamine Bromide

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Methsuximide may be confused with ethosuximide

Pronunciation(meth SUKS i mide)

U.S. Brand NamesCelontin®

Canadian Brand NamesCelontin®

Pharmacologic CategoryAnticonvulsant, Succinimide

Use: Labeled IndicationsControl of absence (petit mal) seizures that are refractory to other drugs

Use: Unlabeled/InvestigationalPartial complex (psychomotor) seizures

Dosing: Adults**Anticonvulsant:** Oral: 300 mg/day for the first week; may increase by 300 mg/day at weekly intervals up to 1.2 g/day in 2-4 divided doses/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Anticonvulsant:** Oral: Children: Initial: 10-15 mg/kg/day in 3-4 divided doses; increase weekly up to maximum of 30 mg/kg/day

StorageProtect from high temperature.

ContraindicationsHypersensitivity to succinimides or any component of the formulation

Allergy Considerations

- Succinimide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Succinimides have been associated with severe blood dyscrasias.
- SLE: Succinimides have been associated with cases of systemic lupus erythematosus (SLE).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Infection: Consider evaluation of blood counts in patients with signs/symptoms of infection.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Other warnings/precautions:

- Appropriate use: Must be used in combination with other anticonvulsants in patients with both absence and tonic-clonic seizures. May increase tonic-clonic seizures in patients with mixed seizure disorders.
- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsNo specific data available for the elderly. This drug is rarely used in the elderly, however, if it is used for partial complex seizure control, monitor closely.
Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Hyperemia

Central nervous system: Ataxia, dizziness, drowsiness, headache, aggressiveness, mental depression, irritability, nervousness, insomnia, confusion, psychosis, suicidal behavior, auditory hallucinations

Dermatologic: Stevens-Johnson syndrome, rash, urticaria, pruritus

Gastrointestinal: Anorexia, nausea, vomiting, weight loss, diarrhea, epigastric and abdominal pain, constipation

Genitourinary: Proteinuria, hematuria (microscopic); cases of blood dyscrasias have been reported with succinimides

Hematologic: Leukopenia, pancytopenia, eosinophilia, monocytosis

Neuromuscular & skeletal: Cases of systemic lupus erythematosus have been reported

Ocular: Blurred vision, photophobia, peripheral edema

Metabolism/Transport Effects**Substrate** of CYP2C19 (major); **Inhibits** CYP2C19 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Monitoring ParametersCBC, hepatic function tests, urinalysis
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 150 mg, 300 mg

Generic AvailableNo
ManufacturerPfizer Inc
Pricing: U.S. (www.drugstore.com)

Capsules (Celontin)

300 mg (30): $46.37

Mechanism of ActionIncreases the seizure threshold and suppresses paroxysmal spike-and-wave pattern in absence seizures; depresses nerve transmission in the motor cortex
Pharmacodynamics/Kinetics

Metabolism: Hepatic; rapidly demethylated to N-desmethylmethsuximide (active metabolite)

Half-life elimination: 2-4 hours

Time to peak, serum: Within 1-3 hours

Excretion: Urine (<1% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Methyclothiazide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Enduron® may be confused with Empirin®, Imuran®, Inderal®

Pronunciation(meth i kloe THYE a zide)

U.S. Brand NamesEnduron® [DSC]

Canadian Brand NamesAquatensen®; Enduron®

Pharmacologic CategoryDiuretic, Thiazide

Use: Labeled IndicationsManagement of mild to moderate hypertension; treatment of edema in congestive heart failure and nephrotic syndrome

Dosing: Adults

Edema: Oral: 2.5-10 mg/day

Hypertension: Oral: 2.5-5 mg/day; may add another antihypertensive if 5 mg is not adequate after a trial of 8-12 weeks of therapy

Dosing: ElderlyRefer to adult dosing.

Administration: OralMay be taken with food or milk. Take early in day to avoid nocturia. Take the last dose of multiple doses no later than 6 PM unless instructed otherwise.

ContraindicationsHypersensitivity to methyclothiazide or any component, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with thiazide or sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations.
- Hypokalemia: Use with caution in patients with hypokalemia; correct before initiating therapy.
- Renal impairment: Avoid in severe renal disease (ineffective).
- Systemic lupus erythematosus (SLE): Can cause SLE exacerbation or activation.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Orthostatic hypotension

Dermatologic: Photosensitivity

Endocrine & metabolic: Hypokalemia

Gastrointestinal: Anorexia, epigastric distress

<1% (Limited to important or life-threatening): Agranulocytosis, aplastic anemia, cutaneous vasculitis, erythema multiforme, hemolytic anemia, hepatic function impairment, hypercalcemia, leukopenia, necrotizing angiitis, pancreatitis, respiratory distress, Stevens-Johnson syndrome, thrombocytopenia, vasculitis

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid dong quai, St John's wort (may also cause photosensitization). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, fluids, weight loss, serum potassium

Nursing: Physical Assessment/MonitoringMonitor positional blood pressure and fluid balance on a regular basis. Monitor for signs of hypokalemia. If used to treat CHF, monitor for signs of effectiveness. Monitor and teach patient to monitor for effectiveness of therapy, possible side effects, precautions, and symptoms to report (see Patient Education). Note breast-feeding caution.

Monitoring: Lab TestsSerum potassium, renal function

Patient EducationTake exactly as directed - with meals. May take early in day to avoid nocturia. Include bananas or orange juice in daily diet but do not take dietary supplements without advice or consultation of prescriber. Do not use OTC medication without consulting prescriber. Weigh weekly at the same time, in the same clothes. Report weight gain >5 lb/week. May cause dizziness or weakness; change position slowly when rising from sitting or lying position and avoid driving or tasks requiring alertness until response to drug is known. You may experience nausea or loss of appetite (small, frequent meals may help); impotence (reversible); constipation (increased exercise, fluids, fruit, or fiber may help); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). This medication does not replace other antihypertensive interventions; follow instructions for diet and lifestyle changes. Report flu-like symptoms, headache, joint soreness or weakness, respiratory difficulty, skin rash, or excessive fatigue, swelling of extremities, or respiratory difficulty. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Methyclothiazide)

5 mg (30): $24.40

Mechanism of ActionInhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water, as well as, potassium and hydrogen ions

Pharmacodynamics/Kinetics

Onset of action: Diuresis: 2 hours

Peak effect: 6 hours

Duration: ~1 day

Distribution: Crosses placenta; enters breast milk

Excretion: Urine (as unchanged drug)

Related Information

- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may cause photosensitivity; use psychotropics with caution; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsThiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. They may act synergistically to lower blood pressure when combined with an ACE inhibitor or beta-blocker. The initial concern about thiazide diuretic-induced hypokalemia, glucose intolerance, and lipid profiles does not appear to be of substantial clinical consequence in the treatment of hypertension. The benefits of this class of agents in the treatment of hypertension is established and compares well with other first-line therapeutic agents.

Diuretics are standard therapy for the management of edema in patients with heart failure.

Medication Safety Issues

Sound-alike/look-alike issues:

Citrucel® may be confused with Citracal®

Pronunciation(meth il SEL yoo lose)

U.S. Brand NamesCitrucel® Fiber Shake [OTC]; Citrucel® Fiber Smoothie [OTC]; Citrucel® [OTC]

Pharmacologic CategoryLaxative

Use: Labeled IndicationsAdjunct in treatment of constipation

Dosing: Adults**Constipation:** Oral:

Citrucel® caplet: 2-4 caplets 1-3 times/day; follow each dose with 8 oz of water

Citrucel® powder: 1 heaping tablespoon (19 g) in 8 oz of cold water, 1-3 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Constipation:** Oral:

Children 6-12 years:

Citrucel® caplet: 1 caplet up to 6 times/day; follow each dose with 8 oz of water

Citrucel® powder: Half the adult dose in 4 oz of cold water, 1-3 times/day

Children ≥12 years: Refer to adult dosing.

Dietary ConsiderationsCitrucel® sugar free formulation: 2 g/level scoop contains phenylalanine 52 mg/level scoop; 2 g/packet contains phenylalanine 52 mg/packet

Warnings/Precautions

Other warnings/precautions:

- OTC labeling: Should not be used for longer than 1 week unless directed by healthcare provider. Healthcare provider should be notified if abdominal pain, nausea, or vomiting are present or in case of a sudden change in bowel habits. All doses must be taken with 8 ounces of water.

Pregnancy Risk FactorC

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/Monitoring**Pregnancy risk factor C** - benefits of use should outweigh possible risks.

Patient EducationTake with a full glass of water. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Citrucel®: 500 mg

Powder: 2 g/level scoop (454 g)

Citrucel® Fiber Smoothie: 2 g/level scoop (275 g, 539 g) [contains sodium 3 mg/level scoop; lemon lime flavor]

Citrucel®:

2 g/level scoop (448 g, 840 g, 1418g, 1843 g) [contains sodium 3 mg and potassium 105 mg per scoop]

2 g/packet (20s) [orange flavor] [DSC]

Citrucel® [sugar free formulation]:

2 g/level scoop (473 g, 907g, 1190 g) [contains phenylalanine 52 mg/level scoop; orange flavor]

2 g/packet (20s) [contains phenylalanine 52 mg/packet; orange flavor] [DSC]

Citrucel® Fiber Shake: 2 g/level scoop (204 g, 413 g) [sugar free; contains sodium 20 mg/level scoop, phenylalanine 49 mg/level scoop and soy lecithin; chocolate flavor]

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Aldoril® may be confused with Aldoclor®, Aldomet®, Elavil®

Pronunciation(meth il DOE pa & hye droe klor oh THYE a zide)

U.S. Brand NamesAldoril®

Canadian Brand NamesApo-Methazide®

Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist; Diuretic, Thiazide

Use: Labeled IndicationsManagement of moderate-to-severe hypertension

Dosing: Adults**Hypertension:** Oral: Dosage titrated on individual components, then switch to combination product; no more than methyldopa 3 g/day and/or hydrochlorothiazide 50 mg/day; maintain initial dose for first 48 hours, then decrease or increase at intervals of not less than 2 days until an adequate response is achieved

Methyldopa 250 mg and hydrochlorothiazide 15 mg: 2-3 times/day

Methyldopa 250 mg and hydrochlorothiazide 25 mg: Twice daily

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: Renal ImpairmentCl$_{cr}$ 30 mL/minute: Thiazides are recommended; loop diuretics are preferred.

Contraindications

Based on **methyldopa** component: Hypersensitivity to methyldopa or any component of the formulation; active hepatic disease; liver disorders previously associated with use of methyldopa; on MAO inhibitors

Based on **hydrochlorothiazide** component: Hypersensitivity to hydrochlorothiazide or any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation; pregnancy

Allergy Considerations

- Methyldopa Allergy
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Appropriate use: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur with hydrochlorothiazide.

- Hemolytic anemia: Methyldopa may rarely produce hemolytic anemia; positive Coombs' test occurs in 10% to 20% of patients (perform periodic CBCs).

- Hepatic effects: Methyldopa may rarely produce liver disorders; use with caution in patients with previous liver disease or dysfunction.

- Photosensitivity: Photosensitization may occur with hydrochlorothiazide.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use hydrochlorothiazide with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use hydrochlorothiazide with caution in patients with moderate or high cholesterol concentrations.
- Hypokalemia: Use hydrochlorothiazide with caution in patients with hypokalemia; correct before initiating therapy.
- Renal impairment: Avoid hydrochlorothiazide in severe renal disease (ineffective). The active metabolites of methyldopa accumulate in uremia.
- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Fixed-dose therapy is not indicated as the initial treatment for hypertension.**

Pharmacodynamics/Kinetics See individual agents.

Related Information

- Hydrochlorothiazide
- Methyldopa

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness, dizziness, anxiety, nightmares, or depression

Mental Health: Effects on Psychiatric Treatment Contraindicated with MAO inhibitors; may rarely cause leukopenia; use caution with clozapine and carbamazepine; associated with lithium toxicity; use alternative antihypertensive agent; methyldopa may interact with psychotropics; monitor blood pressure and clinical status; thiazides may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations Combination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for methyldopa and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. Thiazide therapy improves cardiovascular outcomes in patients with hypertension. Methyldopa is infrequently used alone for the treatment of essential hypertension. See Cardiovascular Considerations for individual agents.

Index Terms Hydrochlorothiazide and Methyldopa

Medication Safety Issues

Sound-alike/look-alike issues:

Methyldopa may be confused with L-dopa, levodopa

Pronunciation(meth il DOE pa)

Canadian Brand NamesApo-Methyldopa®; Nu-Medopa

Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist

Use: Labeled IndicationsManagement of moderate to severe hypertension

Dosing: Adults**Hypertension:**

Oral: Initial: 250 mg 2-3 times/day; increase every 2 days as needed (maximum dose: 3 g/day); usual dose range (JNC 7): 250-1000 mg/day in 2 divided doses

I.V.: 250-1000 mg every 6-8 hours; maximum: 1 g every 6 hours

Dosing: ElderlyOral: Initial: 125 mg 1-2 times/day; increase by 125 mg every 2-3 days as needed. Adjust for renal impairment. See Geriatric Considerations.

Dosing: Pediatric**Hypertension:**

Oral: Initial: 10 mg/kg/day in 2-4 divided doses; increase every 2 days as needed to maximum dose of 65 mg/kg/day. Do not exceed 3 g/day.

I.V.: 5-10 mg/kg/dose every 6-8 hours up to a total dose of 65 mg/kg/24 hours or 3 g/24 hours

Dosing: Renal Impairment

Cl$_{cr}$ >50 mL/minute: Administer every 8 hours.

Cl$_{cr}$ 10-50 mL/minute: Administer every 8-12 hours.

Cl$_{cr}$ <10 mL/minute: Administer every 12-24 hours.

Slightly dialyzable (5% to 20%)

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Infuse over 30 minutes.

Dietary ConsiderationsDietary requirements for vitamin B$_{12}$ and folate may be increased with high doses of methyldopa.

StorageInjectable dosage form is most stable at acid to neutral pH. Stability of parenteral admixture at room temperature (25°C) is 24 hours. Stability of parenteral admixture at refrigeration temperature (4°C) is 4 days.

Reconstitution

Standard diluent: 250-500 mg/100 mL D$_5$W

CompatibilityStable in dextran 6% in NS, D$_5$NS, D$_5$W, sodium bicarbonate 5%, NS.

Y-site administration: Compatible: Esmolol, heparin, meperidine, morphine, theophylline. **Variable (consult detailed reference):** TPN.

Compatibility when admixed: Compatible: Aminophylline, ascorbic acid injection, chloramphenicol, diphenhydramine, heparin, magnesium sulfate, multivitamins, potassium chloride, promazine, sodium bicarbonate, succinylcholine, verapamil, vitamin B complex with C. **Incompatible:** Amphotericin B, methohexital.

ContraindicationsHypersensitivity to methyldopa or any component of the formulation; active hepatic disease; liver disorders previously associated with use of methyldopa; on MAO inhibitors; bisulfite allergy if using oral suspension or injectable

Allergy Considerations

- Methyldopa Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hemolytic anemia: May rarely produce hemolytic anemia; positive Coombs' test occurs in 10% to 20% of patients (perform periodic CBCs).

- Hepatic effects: May rarely produce liver disorders; use with caution in patients with previous liver disease or dysfunction.

- Sedation: Usually transient, sedation may occur during initial therapy or whenever the dose is increased.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; may respond to smaller doses. The active metabolites of methyldopa accumulate in uremia.

Special populations:

- Elderly: Use with caution in the elderly; may experience syncope (avoid by giving smaller doses). Not considered a drug of choice.

- Pregnancy: Often considered the drug of choice for treatment of hypertension in pregnancy.

Dosage form specific issues:

- Injection: Do not use injectable if bisulfite allergy.

Other warnings/precautions:

- Tolerance: May occur usually between the second and third month of therapy; adding a diuretic or increasing the dosage of methyldopa frequently restores blood pressure control.

Geriatric ConsiderationsBecause of its CNS effects, methyldopa is not considered a drug of first choice in the elderly. Adjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsCrosses the placenta. Hypotension reported. A large amount of clinical experience with the use of these drugs for the management of hypertension during pregnancy is available. Available evidence suggests safe use during pregnancy.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsCrosses into breast milk at extremely low levels. AAP considers **compatible** with breast-feeding.

Adverse Reactions

>10%: Cardiovascular: Peripheral edema

1% to 10%:

Central nervous system: Drug fever, mental depression, anxiety, nightmares, drowsiness, headache

Gastrointestinal: Dry mouth

<1% (Limited to important or life-threatening): Orthostatic hypotension, bradycardia (sinus), sodium retention, sexual dysfunction, gynecomastia, hyperprolactinemia, thrombocytopenia, hemolytic anemia, positive Coombs' test, leukopenia, transient leukopenia or granulocytopenia, cholestasis or hepatitis and heptocellular injury, increased liver enzymes, jaundice, cirrhosis, dyspnea, SLE-like syndrome

Drug Interactions

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Methyldopa may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Iron Salts: May decrease the absorption of Methyldopa. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Lithium: Methyldopa may enhance the adverse/toxic effect of Lithium. This may occur without notable changes in serum lithium concentrations. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression). Avoid natural licorice (causes sodium and water retention and increases potassium loss). Avoid garlic (may have increased antihypertensive effect).

Test InteractionsMethyldopa interferes with the following laboratory tests: urinary uric acid, serum creatinine (alkaline picrate method), AST (colorimetric method), and urinary catecholamines (falsely high levels)

Monitoring ParametersBlood pressure, standing and sitting/lying down, CBC, liver enzymes, Coombs' test (direct); blood pressure monitor required during I.V. administration

Nursing: Physical Assessment/MonitoringEvaluate hepatic and renal status prior to beginning therapy. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, anything that affects blood pressure). See Administration for infusion specifics (eg, do not use injectable in presence of bisulfite allergy). Assess results of laboratory tests at baseline and regularly during therapy. Monitor therapeutic effectiveness (normotensive) and adverse reactions (eg, hypotension, bradycardia, CNS changes) on a regular basis. Teach patient use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver enzymes, Coombs' test (direct)

Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially any cough or cold remedies, diet pills, stay-awake medications). **Oral:** Take as directed. Do not skip dose or discontinue without consulting prescriber. Follow recommended diet and exercise program. Periodic laboratory tests may be required. This medication may cause altered color of urine (normal); drowsiness, dizziness, or impaired judgment (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from sitting or lying position or when climbing stairs); or dry mouth or nausea (frequent mouth care or sucking lozenges may help). Report altered CNS status (eg, nightmares, depression, anxiety, increased nervousness); sudden weight gain (weigh yourself in the same clothes at the same time of day once a week); unusual or persistent swelling of ankles, feet, or extremities; palpitations or rapid heartbeat; persistent weakness, fatigue, or unusual bleeding; or other persistent side effects.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as methyldopate hydrochloride: 50 mg/mL (5 mL) [contains sodium bisulfite]

Tablet: 250 mg, 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Methyldopa)

250 mg (120): $25.98

500 mg (60): $25.99

Mechanism of ActionStimulation of central alpha-adrenergic receptors by a false transmitter that results in a decreased sympathetic outflow to the heart, kidneys, and peripheral vasculature

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Hypotensive: Oral/parenteral: 3-6 hours

Duration: 12-24 hours

Distribution: Crosses placenta; enters breast milk

Protein binding: <15%

Metabolism: Intestinal and hepatic

Half-life elimination: 75-80 minutes; End-stage renal disease: 6-16 hours

Excretion: Urine (85% as metabolites) within 24 hours

Related Information

- Depression
- Hypertension

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, anxiety, nightmares, or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors; may rarely cause leukopenia; use caution with clozapine and carbamazepine; associated with lithium toxicity; use alternative antihypertensive agent; methyldopa may interact with psychotropics; monitor blood pressure and clinical status

Cardiovascular ConsiderationsMethyldopa is not routinely used for the treatment of essential hypertension. However, it is still used in the management of pregnancy-associated hypertension. Although the drug crosses the placenta and may cause hypotension, there is a large body of experience using this drug in the treatment of pregnancy-associated hypertension. Overall, the medication appears to be safe during pregnancy and lactation. Important side effects to note are hemolytic anemia, drowsiness, and depression.

Anesthesia and Critical Care Concerns/Other ConsiderationsMost effective if used with diuretic. Titrate dose to optimal blood pressure control with minimal side effects. Patients on methyldopa may need less anesthetic agents. Hypotension readily responds to vasopressors because the adrenergic receptors remain sensitive.

It is used in the management of pregnancy-associated hypertension. Although the drug crosses the placenta and may cause hypotension, there is a large body of experience using this drug in the treatment of pregnancy-associated hypertension. Overall, the medication appears to be safe during pregnancy and lactation.

Index TermsAldomet; Methyldopate Hydrochloride

Methylene Blue

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety IssuesDue to potential toxicity (hemolytic anemia), do not use methylene blue to color enteral feedings to detect aspiration.

Pronunciation(METH i leen bloo)

U.S. Brand NamesUrolene Blue® [DSC]

Pharmacologic CategoryAntidote

Use: Labeled IndicationsAntidote for cyanide poisoning and drug-induced methemoglobinemia, indicator dye

Use: Unlabeled/InvestigationalTreatment/prevention of ifosfamide-induced encephalopathy; topically, in conjunction with polychromatic light to photoinactivate viruses such as herpes simplex; alone or in combination with vitamin C for the management of chronic urolithiasis

Dosing: Adults

Methemoglobinemia: I.V.: 1-2 mg/kg or 25-50 mg/m^2 over several minutes; may be repeated in 1 hour if necessary

Genitourinary antiseptic: Oral: 65-130 mg 3 times/day with a full glass of water (maximum: 390 mg/day)

Ifosfamide-induced encephalopathy (unlabeled use): Oral, I.V.:

Prevention: 50 mg every 6-8 hours

Treatment: 50 mg as a single dose or every 4-8 hours until symptoms resolve

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

NADPH-methemoglobin reductase deficiency: Oral: 1-1.5 mg/kg/day (maximum: 300 mg/day) given with 5-8 mg/kg/day of ascorbic acid

Methemoglobinemia: Children: Refer to adult dosing.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Administer undiluted by direct I.V. injection over several minutes. For the treatment of ifosfamide-induced encephalopathy, methylene blue may be administered either undiluted as a slow I.V. push over at least 5 minutes or diluted in 50 mL NS or D_5W and infused over at least 5 minutes. Consider concomitant dextrose administration, especially in patients who are hypoglycemic, to ensure efficacy of methylene blue.

Administration: OralAdminister after meals with a full glass of water. When given for the treatment of ifosfamide-induced encephalopathy, may be mixed with fruit juice to mask unpleasant taste.

ContraindicationsHypersensitivity to methylene blue or any component of the formulation; intraspinal injection; renal insufficiency

Warnings/Precautions

Concerns related to adverse effects:

- Anemia: Continued use can cause profound anemia.
- Methemoglobinemia: At high doses or in patients with G6PD-deficiency and infants, methylene blue may catalyze the oxidation of ferrous iron in hemoglobin to ferric iron causing paradoxical methemoglobinemia. Monitor methemoglobin concentrations regularly during administration.

Special populations:

- G6PD deficiency: Use with caution in patients with G6PD deficiency.
- Young patients: Use with caution in young patients.

Other warnings/precautions:

- Administration: Do not inject SubQ or intrathecally.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, precordial pain

Central nervous system: Dizziness, mental confusion, headache, fever

Dermatologic: Staining of skin

Gastrointestinal: Fecal discoloration (blue-green), nausea, vomiting, abdominal pain

Genitourinary: Discoloration of urine (blue-green), bladder irritation

Hematologic: Anemia

Miscellaneous: Diaphoresis

Drug Interactions There are no known significant interactions.

Monitoring Parameters Arterial blood gases; cardiac monitoring (patients with pre-existing pulmonary and/or cardiac disease); CBC; methemoglobin levels (co-oximetry yields a direct and accurate measure of methemoglobin levels); pulse oximeter (will not provide accurate measurement of oxygenation when methemoglobin levels are >35%); renal function; signs and symptoms of methemoglobinemia such as pallor, cyanosis, nausea, muscle weakness, dizziness, confusion, agitation, dyspnea and tachycardia; transcutaneous O_2 saturation

Reference Range Methemoglobin levels: **Note:** The level of methemoglobin is expressed as a percent of total hemoglobin affected.

10% to 25%: Cyanosis

35% to 40%: Fatigue, dizziness, dyspnea, headache, tachycardia

60%: Lethargy, stupor

>70%: Death (adults)

Monitoring: Lab Tests Arterial blood gases; CBC; methemoglobin levels (co-oximetry yields a direct and accurate measure of methemoglobin levels); pulse oximeter (will not provide accurate measurement of oxygenation when methemoglobin levels are >35%); renal function; transcutaneous O_2 saturation

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 10 mg/mL (1 mL, 10 mL)

Tablet:

  Urolene Blue®: 65 mg [DSC]

Generic Available Yes: Injection

Pricing: U.S. (www.drugstore.com)

Tablets (Urolene Blue)

  65 mg (30): $19.99

Mechanism of Action Weak germicide in low concentrations, hastens the conversion of methemoglobin to hemoglobin; has opposite effect at high concentrations by converting ferrous ion of reduced hemoglobin to ferric ion to form methemoglobin; in cyanide toxicity, it combines with cyanide to form cyanmethemoglobin preventing the interference of cyanide with the cytochrome system

Pharmacodynamics/Kinetics

Onset of action: Reduction of methemoglobin: I.V.: 30-60 minutes

Absorption: Oral: 53% to 97%

Excretion: Urine and feces

Pharmacotherapy Pearls Skin stains may be removed using a hypochlorite solution.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause confusion or dizziness

Mental Health: Effects on Psychiatric Treatment None reported

Medication Safety Issues

Sound-alike/look-alike issues:

> Methylergonovine and terbutaline parenteral dosage forms look similar. Due to their contrasting indications, use care when administering these agents.

Pronunciation(meth il er goe NOE veen)

U.S. Brand NamesMethergine®

Canadian Brand NamesMethergine®

Pharmacologic CategoryErgot Derivative

Use: Labeled IndicationsPrevention and treatment of postpartum and postabortion hemorrhage caused by uterine atony or subinvolution

Dosing: Adults**Prevention of hemorrhage:**

Oral: 0.2 mg 3-4 times/day in the puerperium for 2-7 days

I.M., I.V.: 0.2 mg after delivery of anterior shoulder, after delivery of placenta, or during puerperium; may be repeated as required at intervals of 2-4 hours

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.Administer over ≥60 seconds. Should not be routinely administered I.V. because of possibility of inducing sudden hypertension and cerebrovascular accident.

Administration: I.V. DetailpH: 2.7-3.5

Storage

Ampul: Store under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light.

Tablet: Store below 25°C (77°F).

CompatibilityStable in NS.

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

ContraindicationsHypersensitivity to methylergonovine or any component of the formulation; ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); hypertension; toxemia; pregnancy

Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.
- Ergotism: Ergot alkaloid use may result in ergotism (intense vasoconstriction) resulting in peripheral vascular ischemia and possible gangrene. Ergotism is usually associated with overdosage or prolonged chronic use; do not exceed dosing guidelines and avoid prolonged administration.
- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use of other ergot alkaloids.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Labor: Use with caution in the second stage of labor.
- Renal impairment: Use with caution in patients with renal impairment.
- Sepsis: Use with caution in patients with sepsis.
- Vascular disease: Use with caution in patients with obliterative vascular disease.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: Concomitant use with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics) and ergot alkaloids has been associated with acute ergot toxicity (ergotism); concurrent use of certain ergot alkaloids (eg, ergotamine and dihydroergotamine) are not recommended by the manufacturer.

Special populations:

- Elderly: Use with extreme caution or avoid use in the elderly; due to vasoconstrictive properties and cardiovascular adverse effects associated with ergot alkaloids.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- I.V. administration: Use with extreme caution when administering intravenously; risk of inducing sudden hypertensive and cerebrovascular accidents.

Pregnancy Risk FactorC

Pregnancy ConsiderationsProlonged constriction of the uterine vessels and/or increased myometrial tone may lead to reduced placental blood flow. This has contributed to fetal growth retardation in animals. Methylergonovine is intended for use after delivery of the infant.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsAt normal doses used to control postpartum uterine bleeding, small amounts are excreted in breast milk.

Adverse ReactionsFrequency not defined.

Cardiovascular: Acute MI, arterial spasm, bradycardia, hyper-/hypotension, palpitation, tachycardia, temporary chest pain

Central nervous system: Dizziness, hallucinations, headache, seizure

Dermatologic: Rash

Endocrine & metabolic: Water intoxication

Gastrointestinal: Diarrhea, foul taste, nausea, vomiting

Local: Thrombophlebitis

Neuromuscular & skeletal: Leg cramps

Otic: Tinnitus

Renal: Hematuria

Respiratory: Dyspnea, nasal congestion

Miscellaneous: Anaphylaxis, diaphoresis

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringBlood pressure, CNS status, and vaginal bleeding should be monitored on a regular basis - especially with infusion or injection. Assess therapeutic effectiveness and adverse response (eg, ergotamine toxicity [headache, ringing in ears, nausea and vomiting, diarrhea, numbness or coldness of extremities, confusion, hallucinations, dyspnea, chest pain, convulsions]). Teach patient proper use (when self-administered), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis drug will generally not be needed for more than a week. May cause nausea and vomiting (small, frequent meals may help), dizziness, headache, or ringing in the ears (will reverse when drug is discontinued). Report immediately any chest pain or tightness, jaw, shoulder or midback pain; difficulty breathing; acute headache; numb, cold, or cramping extremities; or severe abdominal cramping. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as maleate: 0.2 mg/mL (1 mL)

Methergine®: 0.2 mg/mL (1 mL)

Tablet, as maleate:

Methergine®: 0.2 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Methergine)

0.2 mg (30): $43.47

Mechanism of ActionSimilar smooth muscle actions as seen with ergotamine; however, it affects primarily uterine smooth muscles producing sustained contractions and thereby shortens the third stage of labor and reduces blood loss.

Pharmacodynamics/Kinetics

Onset of action: Oxytocic: Oral: 5-10 minutes; I.M.: 2-5 minutes; I.V.: Immediately

Duration: Oral: ~3 hours; I.M.: ~3 hours; I.V.: 45 minutes

Absorption: Rapid

Distribution: V_d: 39-73 L

Rapid; primarily to plasma and extracellular fluid following I.V. administration; tissues

Metabolism: Hepatic

Bioavailability: Oral: 60%; I.M.: 78%

Half-life elimination: Biphasic: Initial: 1-5 minutes; Terminal: 0.5-2 hours

Time to peak, serum: Oral: 0.3-2 hours; I.M.: 0.2-0.6 hours

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause dizziness or hallucinations

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsThis drug should be used extremely carefully because of its potent vasoconstrictor action. Administration may elicit marked increases in blood pressure and intracranial hemorrhage. Use should be avoided in patients with cardiovascular disease, including hypertension, coronary artery disease and peripheral vascular disease.

Anesthesia and Critical Care Concerns/Other ConsiderationsThis drug should be used extremely carefully because of it's potent vasoconstrictor action. I.V. use may induce sudden hypertension and cerebrovascular accidents. As a last resort, give I.V. slowly over several minutes and monitor blood pressure closely.

Index TermsMethylergometrine Maleate; Methylergonovine Maleate

Methylfolate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(meth il FO late)

U.S. Brand NamesDeplin™

Pharmacologic CategoryDietary Supplement

Use: Labeled IndicationsMedicinal food for management of patients with low plasma and/or low red blood cell folate

Dosing: Adults**Medicinal food:** Oral: One tablet (7.5 mg) daily

Dosing: ElderlyRefer to adult dosing.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

ContraindicationsHypersensitivity to any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Anemia: Monotherapy: Not appropriate for monotherapy with pernicious or other megaloblastic anemias when anemia is present with vitamin B_{12} deficiency.

- Pernicious anemia: Doses >0.1 mg/day may obscure pernicious anemia with continuing irreversible nerve damage progression.

Other warnings/precautions:

- Medicinal food: Product is a medicinal food for use only under the supervision of a healthcare provider.

Geriatric ConsiderationsNo special recommendations. Elderly frequently have combined nutritional deficiencies. Must rule out vitamin B_{12} deficiency before initiating folate therapy. Elderly, due to decreased nutrient intake, may benefit from daily intake of a multiple vitamin with minerals.

Drug Interactions

CarBAMazepine: Methylfolate may decrease the serum concentration of CarBAMazepine. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the serum concentration of Methylfolate. *Risk C: Monitor therapy*

Colestipol: May decrease the serum concentration of Methylfolate. *Risk C: Monitor therapy*

PHENobarbital: Methylfolate may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Methylfolate may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Primidone: Methylfolate may decrease the serum concentration of Primidone. *Risk C: Monitor therapy*

Pyrimethamine: Methylfolate may diminish the therapeutic effect of Pyrimethamine. *Risk C: Monitor therapy*

Raltitrexed: Methylfolate may diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Sulfasalazine: May decrease the serum concentration of Methylfolate. *Risk C: Monitor therapy*

Valproic Acid: Methylfolate may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Deplin™: L-methylfolate 7.5 mg [gluten free, lactose free, sugar free, yeast free]

Generic AvailableNo

ManufacturerPamLab

Pricing: U.S. (www.drugstore.com)

Tablets (Deplin)

7.5 mg (30): $49.99

Mechanism of ActionMethylfolate, or L-methylfolate, is the active form of folate in the body, which can be transported into peripheral tissues and across the blood brain barrier. Folate is necessary for formation of numerous coenzymes in many metabolic systems, particularly for purine, pyrimidine, and nucleoprotein synthesis, and maintenance in erythropoiesis; stimulates WBC and platelet production in folate deficiency anemia.

Pharmacotherapy PearlsInformation in this monograph is currently limited to the fields presented. Consult product labeling for additional details.

The manufacturer of Deplin™ indicates a use of methylfolate in individuals who have a major depressive disorder that has not fully responded or may not fully respond to antidepressant therapy. Limited data exists of the investigational use of folate supplementation as an adjunct to the treatment of major depressive disorder. Adjunctive use in major depressive disorders requires further studies, but some studies (using various forms of folic acid) suggest a possible benefit of supplementation by augmentation of response to antidepressants, particularly in patients with low serum folate levels prior to supplementation.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health Comment Pilot studies have explored the potential to improve response to antidepressant treatment with the addition of folate, a water-soluble B vitamin. Alpert et al, evaluated the efficacy of methylfolate as an adjunctive treatment in 22 adults with major depression who had an inadequate response to SSRI therapy in an 8 week prospective trial. Leucovorin (folinic acid), which is metabolized to methylfolate, was added to SSRI therapy at 15-30 mg/day. Hamilton Depression Rating Scale scores decrease significantly ($p < 0.01$) in the 16 completers. Thirty-one percent of the completers and 27% of the intent-to-treat sample achieved response and 19% of the completers and 18% of the intent-to-treat sample achieved remission.

In support of the finding by Alpert et al, assessed the relationship between serum folate, vitamin B_{12}, homocysteine levels, and clinical response in patients with major depression who had previously failed to respond to open treatment with fluoxetine 20 mg/day. Low serum folate levels but not elevated homocysteine or low vitamin B_{12} levels were associated with poorer response to treatment. The response rate for patients with and without low folate levels was 7.1% and 44.7% respectively.

In part two of the above study, Papakostas et al, evaluated the relationship between serum folate, vitamin B_{12}, and homocysteine levels on the rate of relapse in outpatients with remitted major depression during a 28-week continuation phase of treatment with fluoxetine. Low serum folate levels but not elevated homocysteine or low vitamin B_{12} levels were associated with relapse during continuation treatment with fluoxetine. The relapse rate for patients with and without low folate levels was 42.9% and 3.2% respectively.

Further study is necessary to determine to role of methylfolate in the management of major depressive disorder.

Methylnaltrexone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Methylnaltrexone may be confused with naltrexone

Pronunciation(meth il nal TREKS one)
U.S. Brand NamesRelistor™
Canadian Brand NamesRelistor™
Pharmacologic CategoryGastrointestinal Agent, Miscellaneous; Opioid Antagonist, Peripherally-Acting
Use: Labeled IndicationsTreatment of opioid-induced constipation in patients with advanced illness receiving palliative care with inadequate response to conventional laxative regimens
Dosing: Adults**Opioid-induced constipation:** SubQ: Dosing is according to body weight: Administer 1 dose every other day as needed; maximum: 1 dose/24 hours

<38 kg: 0.15 mg/kg (round dose up to nearest 0.1 mL of volume)

38 to <62 kg: 8 mg

62-114 kg: 12 mg

>114 kg: 0.15 mg/kg (round dose up to nearest 0.1 mL of volume)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment
Mild-to-moderate renal impairment: No adjustment required.

Severe renal impairment (Cl_{cr} <30 mL/minute): Administer 50% of normal dose.

End-stage renal impairment (dialysis-dependent): Has not been studied.

Dosing: Hepatic Impairment

Mild-to-moderate hepatic impairment (Child-Pugh class A and B): No adjustment required.

Severe hepatic impairment: Has not been studied.

Calculations

- Creatinine Clearance: Adults

Administration: OtherSubQ: Administer subcutaneously into upper arm, abdomen, or thigh. Rotate injection site. Do not use tender, bruised, red, or hard areas.
StorageStore intact vials at room temperature of 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Do not freeze, protect from light. Solution for injection is stable in a syringe for 24 hours at room temperature (protection from light during this 24 hours is not necessary).
ContraindicationsKnown or suspected mechanical bowel obstruction
Warnings/Precautions

Concerns related to adverse effects:

- Diarrhea: Discontinue treatment for severe or persistent diarrhea.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended for severe renal impairment (Cl_{cr} <30 mL/minute). Has not been studied in patients with end-stage renal impairment requiring dialysis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Peritoneal catheters: Use has not been studied in patients with peritoneal catheters.

Other warnings/precautions:

- Appropriate use: Use beyond 4 months has not been studied. Discontinue methylnaltrexone if opioids are discontinued.

Geriatric ConsiderationsIn small studies (Phase 2 and 3), no differences in safety and efficacy were noted between elderly and young adults. No dose adjustment is required in elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Gastrointestinal: Abdominal pain (29%), flatulence (13%), nausea (12%)

1% to 10%:

Central nervous system: Dizziness (7%)

Gastrointestinal: Diarrhea (6%)

<1%, postmarketing, and/or case reports: Abdominal cramps, body temperature increased, muscle spasm, syncope

Metabolism/Transport Effects**Inhibits** CYP2D6 (weak)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringUse caution in presence of renal impairment (dosage adjustment may be necessary). Evaluate effectiveness and adverse response on a regular basis (discontinue for severe or persistent diarrhea). Must be discontinued if opioids are discontinued. Teach patient or caregiver proper use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber. This medication can only be administered via injection. If self-administered, follow instructions for injection and syringe/needle disposal. May cause dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report immediately any severe or persistent diarrhea or gastrointestinal upset (pain, nausea, vomiting). **Breast-feeding precautions:** Inform prescriber if you are or intend to breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Relistor™: 12 mg/0.6 mL (0.6 mL) [contains edetate calcium disodium]

Generic AvailableNo

ManufacturerWyeth Pharmaceuticals, Inc

Mechanism of ActionAn opioid receptor antagonist which blocks opioid binding at the mu receptor, methylnaltrexone is a quaternary derivative of naltrexone with ability to cross the blood-brain barrier restricted. It therefore functions as a peripheral acting opioid antagonist, including actions on the gastrointestinal tract to inhibit opioid-induced decreased gastrointestinal motility and delay in gastrointestinal transit time, decreasing opioid-induced constipation. Does not affect opioid analgesic effects or induce opioid withdrawal symptoms.

Pharmacodynamics/Kinetics

Onset of action: Usually within 30-60 minutes (in responding patients)

Absorption: SubQ: Rapid

Distribution: V_{ss}: 1.1 L/kg

Protein binding: 11% to 15%

Metabolism: Metabolized to methyl-6-naltrexol isomers, methylnaltrexone sulfate. and other minor metabolites

Half-life elimination: Terminal: ~8 hours

Time to peak, plasma: SubQ: 30 minutes

Excretion: Urine (~50%, primarily as unchanged drug); feces (<50%, primarily as unchanged drug)

Pharmacotherapy PearlsIn some clinical trials, patients who received methylnaltrexone were on a palliative opioid therapy equivalent to a mean daily oral morphine dose of 172 mg, at a stable dose for ≥3 days. Constipation was defined as <3 bowel movements/week or no bowel movement for >2 days. Patients maintained their regular laxative regimen for at least 3 days prior to treatment and throughout the study.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, lithium, carbamazepine, or valproic acid may produce additive effects.

Index TermsMethylnaltrexone Bromide; N-methylnaltrexone Bromide

Special Alerts

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children’s Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Metadate® CD may be confused with Metadate® ER

Metadate® ER may be confused with Metadate® CD, methadone

Methylphenidate may be confused with methadone

Ritalin® may be confused with Ismelin®, Rifadin®, ritodrine

Pronunciation(meth il FEN i date)

U.S. Brand NamesConcerta®; Daytrana™; Metadate® CD; Metadate® ER; Methylin®; Methylin® ER; Ritalin-SR®; Ritalin®; Ritalin® LA

Canadian Brand NamesApo-Methylphenidate®; Apo-Methylphenidate® SR; Biphentin®; Concerta®; PHL-Methylphenidate; PMS-Methylphenidate; RATIO-Methylphenidate; Riphenidate; Ritalin®; Ritalin® SR

Pharmacologic CategoryCentral Nervous System Stimulant

Use: Labeled IndicationsTreatment of attention-deficit/hyperactivity disorder (ADHD); symptomatic management of narcolepsy

Use: Unlabeled/InvestigationalDepression (especially elderly or medically ill)

Dosing: Adults

ADHD: Oral:

Patients not currently taking methylphenidate: Initial dose: 18-36 mg once daily in the morning

Patients currently taking methylphenidate: **Note:** Initial dose: Dosing based on current regimen and clinical judgment; suggested dosing listed below:

- Patients taking methylphenidate 5 mg 2-3 times/day: 18 mg once every morning
- Patients taking methylphenidate 10 mg 2-3 times/day: 36 mg once every morning
- Patients taking methylphenidate 15 mg 2-3 times/day: 54 mg once every morning
- Patients taking methylphenidate 20 mg 2-3 times/day: 72 mg once every morning

Narcolepsy: Oral: 10 mg 2-3 times/day, up to 60 mg/day

Depression (unlabeled use): Oral: Initial: 2.5 mg every morning before 9 AM; dosage may be increased by 2.5-5 mg every 2-3 days as tolerated to a maximum of 20 mg/day; may be divided (ie, 7 AM and 12 noon), but should not be given after noon; do not use sustained release product

Note: Discontinue periodically to re-evaluate or if no improvement occurs within 1 month.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**ADHD:**

Immediate release products Oral: Children ≥6 years: Initial: 5 mg/dose (~0.3 mg/kg/dose) given twice daily before breakfast and lunch; increase by 5-10 mg/day (0.2 mg/kg/day) at weekly intervals; maximum dose: 60 mg/day (2 mg/kg/day). **Note:** Discontinue periodically to re-evaluate or if no improvement occurs within 1 month.

Extended release products: Oral:

Children ≥6 years:

Metadate® ER, Methylin® ER, Ritalin® SR: May be given in place of immediate release products, once the daily dose is titrated and the titrated 8-hour dosage corresponds to sustained or extended release tablet size; maximum: 60 mg/day

Metadate® CD, Ritalin® LA: Initial: 20 mg once daily; may be adjusted in 10-20 mg increments at weekly intervals; maximum: 60 mg/day

Children 6-12 years and Adolescents 13-17 years: *Concerta®:*

Patients not currently taking methylphenidate: Initial dose: 18 mg once daily in the morning

Patients currently taking methylphenidate: **Note:** Initial dose: Dosing based on current regimen and clinical judgment; suggested dosing listed below:

- Patients taking methylphenidate 5 mg 2-3 times/day **or** 20 mg/day sustained release formulation: 18 mg once every morning
- Patients taking methylphenidate 10 mg 2-3 times/day **or** 40 mg/day sustained release formulation: 36 mg once every morning
- Patients taking methylphenidate 15 mg 2-3 times/day **or** 60 mg/day sustained release formulation: 54 mg once every morning

Dose adjustment: May increase dose in increments of 18 mg; dose may be adjusted at weekly intervals. A dosage strength of 27 mg is available for situations in which a dosage between 18-36 mg is desired. Maximum dose should not exceed 2 mg/kg/day **or** 54 mg/day in children 6-12 years or 72 mg/day in children 13-17 years.

Transdermal (Daytrana™): Children ≥6 years: Initial: 10 mg patch once daily; remove up to 9 hours after application. Titrate based on response and tolerability; may increase to next transdermal dose no more frequently than every week. **Note:** Application should occur 2 hours prior to desired effect. Drug absorption may continue for a period of time after patch removal; patients converting from another formulation of methylphenidate should be initiated at 10 mg regardless of their previous dose and titrated as needed due to the differences in bioavailability of the transdermal formulation.

Administration: OralDo not crush or allow patient to chew sustained or extended release dosage form. To effectively avoid insomnia, dosing should be completed by noon.

Concerta®: Administer dose once daily in the morning. May be taken with or without food, but must be taken with water, milk, or juice.

Metadate® CD, Ritalin® LA: Capsules may be opened and the contents sprinkled onto a small amount (equal to 1 tablespoon) of applesauce. Swallow applesauce without chewing. Do not crush or chew capsule contents.

Methylin® chewable tablet: Administer with at least 8 ounces of water or other fluid.

Administration: TopicalTransdermal (Daytrana™): Apply to clean, dry, non-oily, intact skin to the hip area, avoiding the waistline. Apply at the same time each day to alternating hips. Press firmly for 30 seconds to ensure proper adherence. Avoid exposure of application site to external heat source, which may increase the amount of drug absorbed. Do not use a patch that has been damaged or torn; do not cut patch. If patch should dislodge, may replace with new patch (to different site) but total wear time should not exceed 9 hours; do not reapply with dressings, tape, or common adhesives. Patch may be removed early if a shorter duration of effect is desired or if late day side effects occur. Wash hands with soap and water after handling. Avoid touching the sticky side of the patch. If patch removal is difficult, an oil-based product (eg, petroleum jelly, olive oil) may be applied to the patch edges to aid removal; never apply acetone-based products (eg, nail polish remover) to patch. Dispose of used patch by folding adhesive side onto itself, and discard in toilet or appropriate lidded container.

Dietary ConsiderationsShould be taken 30-45 minutes before meals. Concerta® is not affected by food and should be taken with water, milk, or juice. Metadate® CD should be taken before breakfast. Metadate® ER should be taken before breakfast and lunch. Methylin® chewable tablets contain phenylalanine 0.42 mg/methylphenidate 2.5 mg.

Storage

Capsule,*extended release:* Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

Solution: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F).

Tablet:

Chewable: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light and moisture.

Extended and sustained release: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light and moisture.

Immediate release: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light and moisture.

Osmotic controlled release (Concerta®): Store at controlled room temperature of 25°C; excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from humidity.

Transdermal system: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Keep patches stored in protective pouch. Once tray is opened, use patches within 2 months. Do not refrigerate or freeze.

RestrictionsC-II

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to methylphenidate, any component of the formulation, or idiosyncratic reactions to sympathomimetic amines; marked anxiety, tension, and agitation; glaucoma; use during or within 14 days following MAO inhibitor therapy; family history or diagnosis of Tourette's syndrome or tics

Metadate® CD and Metadate® ER: Additional contraindications: Severe hypertension, heart failure, arrhythmia, hyperthyroidism, recent MI or angina; concomitant use of halogenated anesthetics

Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Boxed warnings:

- Drug abuse: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Cardiovascular events: CNS stimulant use has been associated with serious cardiovascular events including sudden death in patients with pre-existing structural cardiac abnormalities or other serious heart problems (sudden death in children and adolescents; sudden death, stroke, and MI in adults). These products should be avoided in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could further increase their risk of sudden death. Patients should be carefully evaluated for cardiac disease prior to initiation of therapy. Some products are contraindicated in patients with heart failure, arrhythmias or recent MI.

- Visual disturbance: Difficulty in accommodation and blurred vision has been reported with the use of stimulants.

Disease-related concerns:

- Drug abuse: **[U.S. Boxed Warning]: Potential for drug dependency exists; avoid abrupt discontinuation in patients who have received for prolonged periods.** Use caution in patients with history of ethanol or drug abuse.

- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate. Some products are contraindicated in patients with severe hypertension, hyperthyroidism or angina.

- Psychiatric disorders: Use with caution in patients with pre-existing psychosis or bipolar disorder (may induce mixed/manic episode). May exacerbate symptoms of behavior and thought disorder in psychotic patients; new onset psychosis or mania may occur with stimulant use; observe for symptoms of aggression and/or hostility.

- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold leading to new onset or breakthrough seizure activity.

Special populations:

- Pediatrics: Not labeled for use in children <6 years of age. Use of stimulants has been associated with suppression of growth in children; monitor growth rate during treatment.

Dosage form specific issues:

- Concerta®: Should not be used with pre-existing severe gastrointestinal narrowing conditions, such as esophageal motility disorders, small bowel disease, “short” gut syndrome, cystic fibrosis, history of peritonitis, chronic intestinal pseudo-obstruction, or Meckel’s diverticulum.

- Daytrana™: Transdermal system may cause allergic contact sensitization, characterized by intense local reactions (eg, edema, papules); sensitization may subsequently manifest systemically with other routes of methylphenidate administration; monitor closely. Avoid exposure of application site to any direct external heat sources (eg, hair dryers, heating pads, electric blankets); may increase risk of overdose. Efficacy of therapy for >7 weeks has not been established.

- Metadate® CD: Contains sucrose; avoid administration in hereditary galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption. Concomitant use with halogenated anesthetics is contraindicated; may cause sudden elevations in blood pressure; if surgery is planned, do not administer Metadate® CD on the day of surgery.

- Metadate® ER: Contains lactose; avoid administration in hereditary galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption. Concomitant use with halogenated anesthetics is contraindicated; may cause sudden elevations in blood pressure; if surgery is planned, do not administer Metadate® ER on the day of surgery.

Other warnings/precautions:

- ADHD treatment: Appropriate use: Recommended to be used as part of a comprehensive treatment program for attention deficit disorders.

- Long-term use: Safety and efficacy of long-term use of methylphenidate have not yet been established.

Geriatric ConsiderationsMethylphenidate is often useful in treating elderly patients who are discouraged, withdrawn, apathetic, or disinterested in their activities. In particular, it is useful in patients who are starting a rehabilitation program but have resigned themselves to fail; these patients may not have a major depressive disorder; will not improve memory or cognitive function; use with caution in patients with dementia who may have increased agitation and confusion.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have shown teratogenic effects to the fetus. There are no adequate and well-controlled studies in pregnant women. Do not use in women of childbearing age unless the potential benefit outweighs the possible risk.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsMethylphenidate excretion into breast milk has been noted in case reports. In both cases, the authors calculated the relative infant dose to be ≤0.2% of the weight adjusted maternal dose. Adverse events were not noted in either infant, however, both were older (6 months of age and 11 months of age) and exposure was limited.

Adverse Reactions

Transdermal system: Frequency of adverse events as reported in trials of 7-week duration. Incidence of some events higher with extended use.

>10%:

Central nervous system: Headache (long-term use in children: 28%), insomnia (13%; long-term use in children: 30%)

Gastrointestinal: Appetite decreased (26%), nausea (12%)

Miscellaneous: Viral infection (long-term use in children: 28%)

1% to 10%:

Central nervous system: Tic (7%), emotional instability (6%)

Gastrointestinal: Vomiting (10%), weight loss (9%), anorexia (5%; long-term use in children: 46%)

Local: Application site reaction

Respiratory: Nasal congestion (6%) nasopharyngitis (5%)

Postmarketing and/or case reports (limited to important or life-threatening): Allergic contact sensitization, anaphylaxis, angioedema, hallucinations, seizures

All dosage forms: Frequency not defined:

Cardiovascular: Angina, cardiac arrhythmia, cerebral arteritis, cerebral occlusion, hyper-/hypotension, MI, murmur, palpitation, pulse increased/decreased, Raynaud's phenomenon, tachycardia

Central nervous system: Aggression, agitation, anger, anxiety, confusional state, depression, dizziness, drowsiness, fatigue, fever, headache, hypervigilance, insomnia, irritability, lethargy, mood alterations, nervousness, neuroleptic malignant syndrome (NMS) (rare), restlessness, stroke, tension, Tourette's syndrome (rare), toxic psychosis, tremor, vertigo

Dermatologic: Alopecia, erythema multiforme, exfoliative dermatitis, hyperhidrosis, rash, urticaria

Endocrine & metabolic: Dysmenorrhea, growth retardation, libido decreased

Gastrointestinal: Abdominal pain, anorexia, appetite decreased, bruxism, constipation, diarrhea, dyspepsia, nausea, vomiting, weight loss, xerostomia

Genitourinary: Erectile dysfunction

Hematologic: Anemia, leukopenia, pancytopenia, thrombocytopenic purpura, thrombocytopenia

Hepatic: Bilirubin increased, liver function tests abnormal, hepatic coma, transaminases increased

Neuromuscular & skeletal: Arthralgia, dyskinesia, muscle tightness, paresthesia

Ocular: Blurred vision, dry eyes, mydriasis, visual accommodation disturbance

Renal: Necrotizing vasculitis

Respiratory: Cough increased, dyspnea, pharyngitis, pharyngolaryngeal pain, rhinitis, sinusitis, upper respiratory tract infection

Miscellaneous: Accidental injury, hypersensitivity reactions

Postmarketing and/or case reports: Alkaline phosphatase increased, angina pectoris, bradycardia, chest pain, diplopia, disorientation, extrasystole, mydriasis; hypersensitivity reactions (eg, angioedema, anaphylactic reactions, auricular swelling, bullous conditions, exfoliative conditions, urticaria, pruritus, rash, eruptions, exanthemas); muscle twitching, hallucinations, mania, erythema, seizure, supraventricular tachycardia, ventricular extrasystole

Metabolism/Transport Effects **Inhibits** CYP2D6 (weak)

Drug Interactions

Antihypertensives: Methylphenidate may diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CloNIDine: Methylphenidate may enhance the adverse/toxic effect of CloNIDine. *Risk C: Monitor therapy*

Inhalational Anesthetics: Methylphenidate may enhance the hypertensive effect of Inhalational Anesthetics. *Risk X: Avoid combination*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Phenytoin: Methylphenidate may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Methylphenidate may decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause CNS depression).

Food: Food may increase oral absorption; Concerta® formulation is not affected. Food delays early peak and high-fat meals increase C_{max} and AUC of Metadate® CD formulation.

Herb/Nutraceutical: Avoid ephedra (may cause hypertension or arrhythmias) and yohimbe (also has CNS stimulatory activity).

Monitoring Parameters Blood pressure, heart rate, signs and symptoms of depression, aggression, or hostility; CBC, differential and platelet counts, liver function tests; growth rate in children, signs of central nervous system stimulation

Transdermal: Signs of worsening erythema, blistering or edema which does not improve within 24 hours of patch removal, or spreads beyond patch site.

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Evaluate periodically for need for continued use. After long-term use, taper dosage slowly when discontinuing. In children, monitor growth pattern. If growth/weight gain is not as expected, may need to discontinue medication. Perform careful cardiovascular assessment prior to initiating therapy. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Monitor blood pressure and pulse periodically. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and importance of reporting adverse symptoms promptly.

Monitoring: Lab TestsPeriodic CBC, differential, and platelet counts with prolonged use; liver function tests

Patient EducationTake exactly as directed. Do not change dosage or discontinue without consulting prescriber. Response may take some time. Do not crush or chew sustained release dosage forms. Tablets and sustained release tablets should be taken 30-45 minutes before meals. Concerta® may be taken with or without food, but must be taken with water, milk, or juice. Metadate® CD and Ritalin® LA capsules may be opened and the contents sprinkled onto a small amount (equal to 1 tablespoon) of applesauce; swallow applesauce without chewing. **Transdermal:** Apply to clean, dry skin, immediately after removing from package. Firmly press in place and hold for 30 seconds. Avoid exposing application site to external heat sources (eg, heating pad, electric blanket, hot tub, heat lamp). Total wear time should not exceed 9 hours. Avoid alcohol, caffeine, or other stimulants. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience decreased appetite or weight loss (small frequent meals may help maintain adequate nutrition); restlessness, impaired judgment, or dizziness, especially during early therapy (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report unresolved rapid heartbeat; excessive agitation, nervousness, worsening of mental symptoms; insomnia, tremors, or dizziness; change in vision; blackened stool; skin rash or irritation; or altered gait or movement. Concerta® tablet shell may appear intact in stool; this is normal. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, extended release, oral, as hydrochloride [bi-modal release]:

Metadate CD®: 10 mg [contains sucrose; 3 mg immediate release, 7 mg extended release]

Metadate CD®: 20 mg [contains sucrose; 6 mg immediate release, 14 mg extended release]

Metadate CD®: 30 mg [contains sucrose; 9 mg immediate release, 21 mg extended release]

Metadate CD®: 40 mg [contains sucrose; 12 mg immediate release, 28 mg extended release]

Metadate CD®: 50 mg [contains sucrose; 15 mg immediate release, 35 mg extended release]

Metadate CD®: 60 mg [contains sucrose; 18 mg immediate release, 42 mg extended release]

Ritalin LA®: 10 mg [5 mg immediate release, 5 mg extended release]

Ritalin LA®: 20 mg [10 mg immediate release, 10 mg extended release]

Ritalin LA®: 30 mg [15 mg immediate release, 15 mg extended release]

Ritalin LA®: 40 mg [20 mg immediate release, 20 mg extended release]

Solution, oral, as hydrochloride:

Methylin®: 5 mg/5 mL (500 mL) [grape flavor]; 10 mg/5 mL (500 mL) [grape flavor]

Tablet, as hydrochloride: 5 mg, 10 mg, 20 mg

Methylin®, Ritalin®: 5 mg, 10 mg, 20 mg

Tablet, chewable, as hydrochloride:

Methylin®: 2.5 mg [contains phenylalanine 0.42 mg; grape flavor]; 5 mg [contains phenylalanine 0.84 mg; grape flavor]; 10 mg [contains phenylalanine 1.68 mg; grape flavor]

Tablet, extended release, as hydrochloride: 20 mg

Metadate® ER: 10 mg [contains lactose]; 20 mg [contains lactose]

Methylin® ER: 10 mg, 20 mg

Tablet, extended release, as hydrochloride [bi-modal release]:

Concerta®: 18 mg [4 mg immediate release, 14 mg extended release]

Concerta®: 27 mg [6 mg immediate release, 21 mg extended release]

Concerta®: 36 mg [8 mg immediate release, 28 mg extended release]

Concerta®: 54 mg [12 mg immediate release, 42 mg extended release]

Tablet, sustained release, as hydrochloride: 20 mg

Ritalin-SR®: 20 mg [dye free]

Transdermal system [once-daily patch]:

Daytrana™: 10 mg/9 hours (10s [DSC], 30s) [12.5 cm^2, total methylphenidate 27.5 mg]

Daytrana™: 15 mg/9 hours (10s [DSC], 30s) [18.75 cm^2, total methylphenidate 41.3 mg]

Daytrana™: 20 mg/9 hours (10s [DSC], 30s) [25 cm^2, total methylphenidate 55 mg]

Daytrana™: 30 mg/9 hours (10s [DSC], 30s) [37.5 cm^2, total methylphenidate 82.5 mg]

Generic AvailableYes: Immediate release tablet, extended release tablet, sustained release tablet

20 mg (20): $42.39

Mechanism of ActionMild CNS stimulant; blocks the reuptake of norepinephrine and dopamine into presynaptic neurons; appears to stimulate the cerebral cortex and subcortical structures similar to amphetamines

Pharmacodynamics/Kinetics

Onset of action: Peak effect:

Immediate release tablet: Cerebral stimulation: ~2 hours

Extended release capsule (Metadate® CD): Biphasic; initial peak similar to immediate release product, followed by second rising portion (corresponding to extended release portion)

Sustained release tablet: 4-7 hours

Osmotic release tablet (Concerta®): Initial: 1-2 hours

Transdermal: ~2 hours; may be expedited by the application of external heat

Duration: Immediate release tablet: 3-6 hours; Sustained release tablet: 8 hours; Extended release tablet: Methylin® ER, Metadate® ER: 8 hours, Concerta®: 12 hours

Absorption:

Oral: Readily absorbed

Transdermal: Absorption increased when applied to inflamed skin or exposed to heat. Absorption is continuous for 9 hours after application.

Metabolism: Hepatic via de-esterification to minimally active metabolite

Half-life elimination: *d*-methylphenidate: 3-4 hours; *l*-methylphenidate: 1-3 hours

Time to peak: Concerta®: C_{max}: 6-8 hours; Daytrana™: 7.5-10.5 hours

Excretion: Urine (90% as metabolites and unchanged drug)

Related Information

- Stimulant Agents Used for ADHD

Pharmacotherapy PearlsTreatment with methylphenidate may include "drug holidays" or periodic discontinuation in order to assess the patient's requirements and to decrease tolerance and limit suppression of linear growth and weight. Specific patients may require 3 doses/day for treatment of ADHD (ie, additional dose at 4 PM).

Concerta® is an osmotic controlled release formulation (OROS®) of methylphenidate. The tablet has an immediate-release overcoat that provides an initial dose of methylphenidate within 1 hour. The overcoat covers a trilayer core. The trilayer core is composed of two layers containing the drug and excipients, and one layer of osmotic components. As water from the gastrointestinal tract enters the core, the osmotic components expand and methylphenidate is released.

Metadate® CD capsules contain a mixture of immediate release and extended release beads, designed to release 30% of the dose immediately and 70% over an extended period.

Ritalin® LA uses a combination of immediate release and enteric coated, delayed release beads.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Up to 10% of patients taking amphetamine-like drugs may present with hypertension. Monitor blood pressure prior to using local anesthetic with vasoconstrictors.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Cardiovascular ConsiderationsAmphetamines should be avoided in patients with known or suspected cardiovascular disease. They may precipitate marked increases in blood pressure, tachycardia, and tachyarrhythmias. These drugs are often used recreationally and inappropriately, particularly for appetite suppressant effects. Recreational use of amphetamines should be considered in otherwise healthy patients with new onset hypertension, tachycardia, or tachyarrhythmias.

There have been cases of sudden death, heart-related death, and stroke in children and adults taking regular recommended doses of Adderall® and Adderall XR®. In Canada, sales of Adderall XR® were suspended for about six months, but have now resumed. Education and additional surveillance will be done of all stimulants used to treat attention deficit hyperactivity disorder. According to the FDA, five of the 12 reported cases of sudden death in pediatric patients occurred in children with cardiac risk factors, including undiagnosed cardiac abnormalities. The other seven cases were complicated by other illness, rigorous exercise, or family history of ventricular arrhythmia. In addition, unexplained or unusual drug accumulation (resulting in toxic levels despite usual dosing) has been noted in several cases. The drug should not be used in patients with structural heart disease. Further information is available at the following websites:

Medication Safety Issues

Sound-alike/look-alike issues:

MethylPREDNISolone may be confused with medroxyPROGESTERone, predniSONE

Depo-Medrol® may be confused with Solu-Medrol®

Medrol® may be confused with Mebaral®

Solu-Medrol® may be confused with Depo-Medrol®, salmeterol, Solu-Cortef®

International issues:

Medor® may be confused with Medral® which is a brand name for omeprazole in Mexico

Pronunciation(meth il pred NIS oh lone)

U.S. Brand NamesDepo-Medrol®; Medrol®; Solu-Medrol®

Canadian Brand NamesDepo-Medrol®; Medrol®; Methylprednisolone Acetate; Solu-Medrol®

Pharmacologic CategoryCorticosteroid, Systemic

Use: Labeled IndicationsPrimarily as an anti-inflammatory or immunosuppressant agent in the treatment of a variety of diseases including those of hematologic, allergic, inflammatory, neoplastic, and autoimmune origin. Prevention and treatment of graft-versus-host disease following allogeneic bone marrow transplantation.

Use: DentalTreatment of a variety of oral diseases of allergic, inflammatory, or autoimmune origin

Dosing: Adults**Only sodium succinate may be given I.V.;** methylprednisolone sodium succinate is highly soluble and has a rapid effect by I.M. and I.V. routes. Methylprednisolone acetate has a low solubility and has a sustained I.M. effect.

Anti-inflammatory or immunosuppressive:

Oral: 2-60 mg/day in 1-4 divided doses to start, followed by gradual reduction in dosage to the lowest possible level consistent with maintaining an adequate clinical response.

I.M. (sodium succinate): 10-80 mg/day once daily

I.M. (acetate): 10-80 mg every 1-2 weeks

I.V. (sodium succinate): 10-40 mg over a period of several minutes and repeated I.V. or I.M. at intervals depending on clinical response; when high dosages are needed, give 30 mg/kg over a period ≥30 minutes and may be repeated every 4-6 hours for 48 hours.

Allergic conditions: Oral: Tapered-dosage schedule:

Day 1: 24 mg on day 1 administered as 8 mg before breakfast, 4 mg after lunch, 4 mg after supper, and 8 mg at bedtime **OR** 24 mg as a single dose or divided into 2 or 3 doses upon initiation (regardless of time of day)

Day 2: 20 mg on day 2 administered as 4 mg before breakfast, 4 mg after lunch, 4 mg after supper, and 8 mg at bedtime

Day 3: 16 mg on day 3 administered as 4 mg before breakfast, 4 mg after lunch, 4 mg after supper, and 4 mg at bedtime

Day 4: 12 mg on day 4 administered as 4 mg before breakfast, 4 mg after lunch, and 4 mg at bedtime

Day 5: 8 mg on day 5 administered as 4 mg before breakfast and 4 mg at bedtime

Day 6: 4 mg on day 6 administered as 4 mg before breakfast

Status asthmaticus: I.V. (sodium succinate): Loading dose: 2 mg/kg/dose, then 0.5-1 mg/kg/dose every 6 hours for up to 5 days

Acute spinal cord injury: I.V. (sodium succinate): 30 mg/kg over 15 minutes, followed in 45 minutes by a continuous infusion of 5.4 mg/kg/hour for 23 hours

Lupus nephritis: High-dose “pulse” therapy: I.V. (sodium succinate): 1 g/day for 3 days

Aplastic anemia: I.V. (sodium succinate): 1 mg/kg/day or 40 mg/day (whichever dose is higher), for 4 days. After 4 days, change to oral and continue until day 10 or until symptoms of serum sickness resolve, then rapidly reduce over approximately 2 weeks.

Pneumonia in AIDS patients due to*Pneumocystis:* I.V.: 30 mg twice daily for 5 days, then 30 mg once daily for 5 days, then 15 mg once daily for 11 days

Arthritis: Intra-articular (acetate): Administer every 1-5 weeks.

Large joints: 20-80 mg

Small joints: 4-10 mg

Intralesional (acetate): 20-60 mg every 1-5 weeks

Dosing: ElderlyOnly sodium succinate salt may be given I.V. Use the lowest effective adult dose.
Dosing: PediatricDosing should be based on the lesser of ideal body weight or actual body weight. **Only sodium succinate may be given I.V.;** methylprednisolone sodium succinate is highly soluble and has a rapid effect by I.M. and I.V. routes. Methylprednisolone acetate has a low solubility and has a sustained I.M. effect.

Acute spinal cord injury: I.V. (sodium succinate): 30 mg/kg over 15 minutes, followed in 45 minutes by a continuous infusion of 5.4 mg/kg/hour for 23 hours

Anti-inflammatory or immunosuppressive: Oral, I.M., I.V. (sodium succinate): 0.5-1.7 mg/kg/day **or** 5-25 mg/m^2/day in divided doses every 6-12 hours; "Pulse" therapy: 15-30 mg/kg/dose over ≥30 minutes given once daily for 3 days

Asthma exacerbations, including status asthmaticus (emergency medical care or hospital doses) (NIH Asthma Guidelines, NAEPP, 2007): Children <12 years: Oral, I.V.: 1-2 mg/kg/day in 2 divided doses (maximum: 60 mg/day) until peak expiratory flow is 70% of predicted or personal best

Lupus nephritis: I.V. (sodium succinate): 30 mg/kg over ≥30 minutes every other day for 6 doses

Status asthmaticus: I.V. (sodium succinate): Previous NAEPP guidelines still encountered in clinical practice: Loading dose: 2 mg/kg/dose, then 0.5-1 mg/kg/dose every 6 hours for up to 5 days; **Note:** See new dosing guidelines for asthma exacerbations above.

Dosing: Renal Impairment

Hemodialysis effects: Slightly dialyzable (5% to 20%)

Administer dose posthemodialysis.

Dosing: Combination Regimens

Brain tumors: 8 in 1 (Brain Tumors)

Leukemia, acute lymphocytic: Hyper-CVAD (Leukemia, Acute Lymphocytic)

Lymphoma, non-Hodgkin's: ESHAP

Retinoblastoma: 8 in 1 (Retinoblastoma)

Calculations

- Body Surface Area: Pediatrics
- Corticosteroid Conversion

Administration: I.V.Only sodium succinate formulation may be given I.V. Acetate salt should not be given I.V.
Parenteral: Methylprednisolone sodium succinate may be administered I.M. or I.V.; I.V. administration may be IVP over one to several minutes or IVPB or continuous I.V. infusion.

I.V.: Succinate:

Low dose: ≤1.8 mg/kg or ≤125 mg/dose: I.V. push over 3-15 minutes

Moderate dose: ≥2 mg/kg or 250 mg/dose: I.V. over 15-30 minutes

High dose: 15 mg/kg or ≥500 mg/dose: I.V. over ≥30 minutes

Doses >15 mg/kg or ≥1 g: Administer over 1 hour

Do **not** administer high-dose I.V. push; hypotension, cardiac arrhythmia, and sudden death have been reported in patients given high-dose methylprednisolone I.V. push (>0.5 g over <10 minutes). Intermittent infusion over 15-60 minutes; maximum concentration: I.V. push 125 mg/mL.

Administration: I.V. DetailpH: 7-8 (adjusted with sodium hydroxide)
Administration: OralGive oral formulation with meals to decrease GI upset. Give daily dose in the morning to mimic normal peak blood levels.
Administration: TopicalFor external use only. Apply sparingly.
Dietary ConsiderationsShould be taken after meals or with food or milk; need diet rich in pyridoxine, vitamin C, vitamin D, folate, calcium, phosphorus, and protein.

Sodium content of 1 g sodium succinate injection: 2.01 mEq; 53 mg of sodium succinate salt is equivalent to 40 mg of methylprednisolone base

Methylprednisolone acetate: Depo-Medrol®

Methylprednisolone sodium succinate: Solu-Medrol®

StorageIntact vials of methylprednisolone sodium succinate should be stored at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light. Reconstituted solutions of methylprednisolone sodium succinate should be stored at room temperature of 20°C to 25°C (68°F to 77°F) and used within 48 hours. Stability of parenteral admixture at room temperature (25°C) and at refrigeration temperature (4°C) is 48 hours.

Reconstitution

Standard diluent (Solu-Medrol®): 40 mg/50 mL D_5W; 125 mg/50 mL D_5W.

Minimum volume (Solu-Medrol®): 50 mL D_5W.

Compatibility**Incompatible** with $D_5{}^1/_2NS$; **variable stability (consult detailed reference)** in D_5NS, D_5W, LR, NS.

Y-site administration: Compatible: Acyclovir, amifostine, amiodarone, amphotericin B cholesteryl sulfate complex, aztreonam, cefepime, cisplatin, cladribine, cyclophosphamide, cytarabine, dopamine, doxorubicin, doxorubicin liposome, enalaprilat, famotidine, fludarabine, gatifloxacin, granisetron, heparin, inamrinone, linezolid, melphalan, meperidine, methotrexate, metronidazole, midazolam, morphine, piperacillin/tazobactam, remifentanil, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, topotecan. **Incompatible:** Allopurinol, amsacrine, ciprofloxacin, docetaxel, etoposide phosphate, filgrastim, gemcitabine, ondansetron, paclitaxel, propofol, sargramostim, vinorelbine. **Variable (consult detailed reference):** Cisatracurium, diltiazem, heparin with hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Compatibility in syringe: Compatible: Diatrizoate meglumine 52% and diatrizoate sodium 8%, diatrizoate sodium 60%, granisetron, iohexol, iopamidol, iothalamate meglumine 60%, ioxaglate meglumine 39.3% and ioxaglate sodium 19.6%, metoclopramide. **Incompatible:** Doxapram.

Compatibility when admixed: Compatible: Chloramphenicol, cimetidine, clindamycin, dopamine, granisetron, heparin, norepinephrine, penicillin G potassium, ranitidine, theophylline, verapamil. **Incompatible:** Calcium gluconate, glycopyrrolate, insulin (regular), metaraminol, nafcillin, penicillin G sodium. **Variable (consult detailed reference):** Aminophylline, amphotericin B, cytarabine.

ContraindicationsHypersensitivity to methylprednisolone or any component of the formulation; viral, fungal, or tubercular skin lesions; administration of live virus vaccines; serious infections, except septic shock or tuberculous meningitis. Methylprednisolone formulations containing benzyl alcohol preservative are contraindicated in infants. I.M. administration contraindicated in idiopathic thrombocytopenia purpura.

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Head injury: Increased mortality was observed in patients receiving high-dose I.V. methylprednisolone; high-dose corticosteroids should not be used for the management of head injury.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.

- Pediatrics: May affect growth velocity; growth should be routinely monitored in pediatric patients.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw therapy with gradual tapering of dose.

Geriatric ConsiderationsBecause of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly, in the smallest possible dose, and for the shortest possible time.

Pregnancy ConsiderationsAdverse events have been observed with corticosteroids in animal reproduction studies. Methylprednisolone crosses the placenta. Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Pregnant women exposed to methylprednisolone for antirejection therapy following a transplant may contact the National Transplantation Pregnancy Registry (NTPR) at 215-955-4820. Women exposed to methylprednisolone during pregnancy for the treatment of an autoimmune disease may contact the OTIS Autoimmune Diseases Study at 877-311-8972.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsLow levels of methylprednisolone are excreted in breast milk

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, edema, hypertension

Central nervous system: Delirium, euphoria, hallucinations, headache, insomnia, mood swings, nervousness, pseudotumor cerebri, psychosis, seizure, vertigo

Dermatologic: Acne, bruising, hirsutism, hyperpigmentation, skin atrophy

Endocrine & metabolic: Adrenal suppression, alkalosis, amenorrhea, Cushing's syndrome, diabetes mellitus, glucose intolerance, hyperglycemia, hyperlipidemia, hypokalemia, growth suppression, pituitary-adrenal axis suppression, sodium and water retention

Gastrointestinal: Abdominal distention, appetite Increased, indigestion, nausea, pancreatitis, peptic ulcer, ulcerative esophagitis, vomiting

Hematologic: Leukocytosis (transient)

Neuromuscular & skeletal: Arthralgia, fractures, muscle weakness, osteoporosis

Ocular: Cataracts, glaucoma

Miscellaneous: Avascular necrosis, hypersensitivity reactions, infection, intractable hiccups, secondary malignancy

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2C8 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase gastric mucosal irritation).

Food: Methylprednisolone interferes with calcium absorption. Limit caffeine.

Herb/Nutraceutical: St John's wort may decrease methylprednisolone levels. Avoid cat's claw, echinacea (have immunostimulant properties).

Test InteractionsInterferes with skin tests

Monitoring ParametersBlood pressure, blood glucose, electrolytes

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor for effectiveness of therapy and adverse reactions according to dose, route, and length of therapy (especially with systemic administration). Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report (ie, opportunistic infection, adrenal suppression). Instruct patients with diabetes to monitor serum glucose levels closely; corticosteroids can alter glycemic response. Dose may need to be increased if patient is experiencing higher than normal levels of stress. When discontinuing, taper dose and frequency slowly.

Monitoring: Lab TestsBlood glucose, electrolytes

Patient EducationMaintain adequate nutritional intake; consult prescriber for possibility of special dietary instructions. If you have diabetes, monitor serum glucose closely and notify prescriber of any changes; this medication can alter glycemic response. Avoid alcohol. Inform prescriber if you are experiencing unusual stress; dosage may need to be adjusted. You will be susceptible to infection (avoid crowds and and exposure to infection). You may experience insomnia or nervousness; use caution when driving or engaging in tasks requiring alertness until response to drug is known. Report increased pain, swelling, or redness in area being treated; excessive or sudden weight gain; swelling of extremities; respiratory difficulty; muscle pain or weakness; change in menstrual pattern; vision changes; signs of hyperglycemia; signs of infection (eg, fever, chills, mouth sores, perianal itching, vaginal discharge); blackened stool; other persistent side effects; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Oral: Take as directed, with food or milk. Take once-a-day dose in the morning. Do not take more than prescribed or discontinue without consulting prescriber.

Intra-articular: Refrain from excessive use of joint following therapy, even if pain is gone.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium succinate: 40 mg, 125 mg, 500 mg, 1 g [strength expressed as base]

Solu-Medrol®: 40 mg, 125 mg, 500 mg, 1 g, 2 g [contains benzyl alcohol (in diluent); strength expressed as base]

Solu-Medrol®: 500 mg, 1 g

Injection, suspension, as acetate: 40 mg/mL (5 mL, 10 mL); 80 mg/mL (5 mL)

Depo-Medrol®: 20 mg/mL (5 mL); 40 mg/mL (5 mL); 80 mg/mL (5 mL) [contains benzyl alcohol; strength expressed as base]

Depo-Medrol®: 40 mg/mL (1 mL); 80 mg/mL (1 mL)

Tablet: 4 mg

Medrol®: 2 mg, 4 mg, 8 mg, 16 mg, 32 mg

Tablet, dose-pack: 4 mg (21s)

Medrol® Dosepak™: 4 mg (21s)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

16 mg (30): $102.52

32 mg (25): $123.45

Tablets (Medrol (Pak))

4 mg (21): $37.79

Tablets (MethylPREDNISolone)

4 mg (30): $17.99

8 mg (25): $45.99

Mechanism of ActionIn a tissue-specific manner, corticosteroids regulate gene expression subsequent to binding specific intracellular receptors and translocation into the nucleus. Corticosteroids exert a wide array of physiologic effects including modulation of carbohydrate, protein, and lipid metabolism and maintenance of fluid and electrolyte homeostasis. Moreover cardiovascular, immunologic, musculoskeletal, endocrine, and neurologic physiology are influenced by corticosteroids. Decreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability.

Pharmacodynamics/Kinetics

Onset of action: Peak effect (route dependent): Oral: 1-2 hours; I.M.: 4-8 days; Intra-articular: 1 week; methylprednisolone sodium succinate is highly soluble and has a rapid effect by I.M. and I.V. routes

Duration (route dependent): Oral: 30-36 hours; I.M.: 1-4 weeks; Intra-articular: 1-5 weeks; methylprednisolone acetate has a low solubility and has a sustained I.M. effect

Distribution: V_d: 0.7-1.5 L/kg

Half-life elimination: 3-3.5 hours; reduced in obese

Excretion: Clearance: Reduced in obese

Related Information

- Contrast Media Reactions, Premedication for Prophylaxis
- Corticosteroids

Pharmacotherapy PearlsSodium content of 1 g sodium succinate injection: 2.01 mEq; 53 mg of sodium succinate salt is equivalent to 40 mg of methylprednisolone base

Methylprednisolone acetate: Depo-Medrol®

Methylprednisolone sodium succinate: Solu-Medrol®

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Ulcerative esophagitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNervousness and insomnia are common; may rarely cause delirium, mood swings, euphoria, or hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates may increase the clearance of methylprednisolone

Cardiovascular ConsiderationsLong-term steroid therapy is associated with fluid retention and hypertension. Glucocorticoid agents have some mineralocorticoid activity with consequent hemodynamic effects. Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. In discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia.

Oral and intravenous steroid therapy in patients with heart failure should be administered cautiously with special attention given to signs and symptoms of fluid retention.

Although glucocorticoids can provide relief from pericarditis postmyocardial infarctions, these drugs may cause thinning of the developing scar and myocardial rupture.

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Neuromuscular Effects: ICU-acquired paresis was recently studied in five ICUs (three medical and two surgical ICUs) at four French hospitals. All ICU patients without pre-existing neuromuscular disease admitted from March 1999 through June 2000 were evaluated (de Jonghe, 2002). Each patient had to be mechanically-ventilated for ≥7 days and was screened daily for awakening. The first day the patient was considered awake was Study Day 1. Patients with severe muscle weakness on Study Day 7 were considered to have ICU-acquired paresis. Among the 95 patients who were evaluated, about 25% developed ICU-acquired paresis. Independent predictors included female gender, the number of days with ≥2 organ dysfunction, and administration of corticosteroids. Further studies may be required to verify and characterize the association between the development of ICU-acquired paresis and use of corticosteroids. Concurrent use of a corticosteroid and muscle relaxant appears to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible.

Adrenal Insufficiency: Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. When discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. Patients on long-term steroid supplementation will require higher corticosteroid doses when subject to stress (eg, trauma, surgery, severe infection). Guidelines for glucocorticoid replacement during various surgical procedures have been published (Coursin, 2002; Salem, 1994).

Septic Shock: Annane, et al (2002) randomized 300 septic shock patients to either hydrocortisone (50 mg I.V. push every 6 hours) and fludrocortisone (50 mcg tablet daily via nasogastric tube) or matching placebos for 7 days. The mean Simplified Acute Physiology Score II (SAPS II) was 57 ± 19 in the placebo group and 60 ± 19 in the active treatment group. The Logistic Organ Dysfunction score was 9 ± 3 in the placebo group and 9 ± 3 in the active treatment group. In patients who did not appropriately respond to corticotropin (nonresponders), there were significantly fewer deaths in the active treatment group. Vasopressor therapy was withdrawn more frequently in this subset of the active treatment group. Adverse events were similar in both groups.

In the CORTICUS trial (Sprung, 2008), 484 septic shock patients were randomized within 72 hours of onset to receive either hydrocortisone (50 mg I.V. push every 6 hours) or placebo for 5 days followed by a 6-day taper. The primary endpoint was 28 day mortality in patients who did not respond to corticotropin. The SAPS II score in the treatment group was 49.5 ± 17.8 and 48.6 ± 16.7 in the placebo group. The Sequential Organ Failure Assessment scores were 10.6 ± 3.4 in the treatment group and 10.6 ± 3.2 in the placebo group. Different than the Annane study, in the patients who did not respond to corticotropin, there was no mortality difference at 28 days; 39.2% (95% CI: 30.5-47.9) mortality in the hydrocortisone group and 36.1% (95% CI: 26.9-45.3, P=0.69) mortality in the placebo group. A trend towards increased incidence of superinfection was noted in hydrocortisone patients. New septic shock episodes, hyperglycemia, and hypernatremia were more frequent in the hydrocortisone group. Hydrocortisone did not improve survival in this population of septic shock patients regardless of corticotropin response.

The 2008 Surviving Sepsis Campaign Guidelines suggest the following: Intravenous hydrocortisone be given only to adult septic shock patients after blood pressure is identified to be poorly responsive to fluid resuscitation and vasopressor therapy (Grade 2C); ACTH stimulation test not be used to identify the subset of adults with septic shock who should receive hydrocortisone (Grade 2B); patients with septic shock should not receive dexamethasone if hydrocortisone is available (Grade 2B); the addition of fludrocortisone if hydrocortisone is not available and the steroid that is substituted does not have significant mineralocorticoid activity (Grade 2C); doses of corticosteroids comparable to >300 mg hydrocortisone daily **not** be used in severe sepsis or septic shock for the purpose of treating septic shock (Grade 1A). They also recommend corticosteroids **not** be administered for the treatment of sepsis in the absence of shock. There is, however, no contraindication to continuing maintenance steroid therapy or to using stress dose steroids if the patient's endocrine or corticosteroid administration history warrants (Grade 1D).

The 2008 Recommendations for the diagnosis and management of corticosteroid insufficiency in critically ill adult patients recommend a diagnosis of critical illness related corticosteroid insufficiency can be made by a delta cortisol level (after 250 mcg cosyntropin) of <9 mcg/dL or a random cortisol <10 mcg/dL (Grade 2B). However, they recommend **against** the use of ACTH stimulation test to determine if septic shock or ARDS patients should receive steroid therapy (Grade 2B). They recommend to consider using hydrocortisone in septic shock patients who have responded poorly to resuscitation and vasopressors (Grade 2B) and glucocorticoid treatment should be tapered slowly and not stopped abruptly (Grade 2B). Dexamethasone is **not** recommended for the treatment of septic shock or ARDS (Grade 1B). Fludrocortisone therapy is considered optional (Grade 2B).

Index Terms 6-α-Methylprednisolone; A-Methapred; Methylprednisolone Acetate; Methylprednisolone Sodium Succinate

Medication Safety Issues

Sound-alike/look-alike issues:

MethylTESTOSTERone may be confused with medroxyPROGESTERone

Virilon® may be confused with Verelan®

Pronunciation(meth il tes TOS te rone)
U.S. Brand NamesAndroid®; Methitest™; Testred®; Virilon®
Pharmacologic CategoryAndrogen
Use: Labeled Indications

Male: Hypogonadism; delayed puberty; impotence and climacteric symptoms

Female: Palliative treatment of metastatic breast cancer

Dosing: Adults **Note:** Buccal absorption produces twice the androgenic activity of oral tablets.

Hypogonadism; delayed puberty; impotence and climacteric symptoms (Male): Oral: 10-40 mg/day

Androgen deficiency (Male):

Oral: 10-50 mg/day

Buccal: 5-25 mg/day

Postpubertal cryptorchidism (Male): Oral: 30 mg/day

Breast pain/engorgement (Female):

Oral: 80 mg/day for 3-5 days

Buccal: 40 mg/day for 3-5 days

Breast cancer (Female):

Oral: 50-200 mg/day

Buccal: 25-100 mg/day

Dosing: ElderlyRefer to adult dosing.
RestrictionsC-III
ContraindicationsHypersensitivity to methyltestosterone or any component of the formulation; in males, known or suspected carcinoma of the breast or the prostate; pregnancy
Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hepatic effects: Prolonged use and/or high doses may cause peliosis hepatis or liver cell tumors which may not be apparent until liver failure or intra-abdominal hemorrhage develops. Discontinue in case of cholestatic hepatitis with jaundice or abnormal liver function tests.

Disease-related concerns:

- Breast cancer: Use with caution in patients with breast cancer; may cause hypercalcemia by stimulating osteolysis.

- Diabetes: Use with caution in patients with diabetes mellitus; monitor carefully.

- Edematous conditions: Use with caution in patients with conditions influenced by edema (eg, cardiovascular disease, migraine, seizure disorder, renal impairment); may cause fluid retention.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Elderly: Use with caution in elderly patients, they may be at greater risk for prostatic hyperplasia, fluid retention, and transaminase elevations.
- Pediatrics: May accelerate bone maturation without producing compensatory gain in linear growth in children; in prepubertal children perform radiographic examination of the hand and wrist every 6 months to determine the rate of bone maturation and to assess the effect of treatment on the epiphyseal centers.
- Women: Discontinue with evidence of mild virilization in women.

Geriatric ConsiderationsSince elderly males have prostate changes with age, it would be best to obtain a PSA initially and periodically. Retention of sodium and water could be a problem in patients with CHF and hypertension.
Pregnancy Risk FactorX
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsFrequency not defined.

Male: Virilism, priapism, prostatic hyperplasia, prostatic carcinoma, impotence, testicular atrophy, gynecomastia

Female: Virilism, menstrual problems (amenorrhea), breast soreness, hirsutism (increase in pubic hair growth), atrophy

Cardiovascular: Edema

Central nervous system: Headache, anxiety, depression

Dermatologic: Acne, “male pattern” baldness, seborrhea

Endocrine & metabolic: Hypercalcemia, hypercholesterolemia

Gastrointestinal: GI irritation, nausea, vomiting

Hematologic: Leukopenia, polycythemia

Hepatic: Hepatic dysfunction, hepatic necrosis, cholestatic hepatitis

Miscellaneous: Hypersensitivity reactions

Drug Interactions

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersIn prepubertal children, perform radiographic examination of the hand and wrist every 6 months to determine the rate of bone maturation and to assess the effect of treatment on the epiphyseal centers.
Nursing: Physical Assessment/MonitoringUse extreme caution in presence of hepatic, renal, or cardiovascular disease. Assess potential for interactions with other pharmacological agents patient may be taking (eg, effects of hypoglycemic agents may be increased). Assess therapeutic effects (according to purpose for use) and adverse response (eg, virilism [male and female], edema, CNS changes [anxiety, depression], acne, baldness, GI irritation, leukopenia, hepatic dysfunction) frequently during therapy. Caution patients with diabetes; effects of hypoglycemic agents may be increased. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Instruct patients of childbearing age or males who may have intercourse with women of childbearing age on appropriate contraceptive measures. Breast-feeding is contraindicated.
Patient EducationTake as directed; do not discontinue without consulting prescriber. If you have diabetes, monitor serum glucose closely and notify prescriber of changes; this medication can alter hypoglycemic requirements. May cause acne, growth of body hair, loss of libido, impotence, or menstrual irregularity (usually reversible); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report changes in menstrual pattern; deepening of voice or unusual growth of body hair; gynecomastia or breast soreness; priapism; fluid retention (swelling of ankles, feet, or hands, respiratory difficulty, or sudden weight gain); change in color of urine or stool; yellowing of eyes or skin; unusual bruising or bleeding; unusual fatigue or weakness; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant or cause a pregnancy (males) during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule (Android®, Testred®, Virilon®): 10 mg

Tablet (Methitest™): 10 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Capsules (Android)

10 mg (60): $405.98

Capsules (Testred)

Medication Safety Issues

Sound-alike/look-alike issues:

Metipranolol may be confused with metaproterenol

International issues:

Betanol® [Monaco] may be confused with Beta-Val® which is a brand name for betamethasone in the U.S.

Betanol® [Monaco] may be confused with Patanol® which is a brand name for olopatadine in the U.S.

Betanol® [Monaco] may be confused with Betimol® which is a brand name for timolol in the U.S.

Pronunciation(met i PRAN oh lol)

U.S. Brand NamesOptiPranolol®

Canadian Brand NamesOptiPranolol®

Pharmacologic CategoryBeta Blocker, Nonselective; Ophthalmic Agent, Antiglaucoma

Use: Labeled IndicationsAgent for lowering intraocular pressure in patients with chronic open-angle glaucoma

Dosing: AdultsGlaucoma: Ophthalmic: Instill 1 drop in the affected eye(s) twice daily

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to metipranolol or any component of the formulation; bronchial asthma, sinus bradycardia, second- and third-degree AV block, cardiac failure, cardiogenic shock

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

Special populations:

- Contact lens wearers: Some products may contain benzalkonium chloride which may be absorbed by soft contact lenses; remove lens prior to administration and wait 15 minutes before reinserting.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.
- Absorption: Systemic absorption and adverse effects may occur with ophthalmic use, including bradycardia and/or hypotension.

Geriatric ConsiderationsBecause systemic absorption occurs with ophthalmic administration, elderly patients with other disease states or syndromes that may be affected by a beta-blocker (ie, CHF, COPD, etc) should be closely monitored.

Pregnancy Risk FactorC

Adverse Reactions

>10%: Ocular: Mild ocular stinging and discomfort, eye irritation

1% to 10%: Ocular: Blurred vision, browache

<1%: Bradycardia, AV block, CHF, erythema, weakness, conjunctivitis, blepharitis, tearing, itching eyes, keratitis, photophobia, decreased corneal sensitivity, bronchospasm

Drug Interactions

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Patient EducationIntended for twice-daily dosing. Keep eye open and do not blink for 30 seconds after instillation. Wear sunglasses to avoid photophobic discomfort.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: 0.3% (5 mL, 10 mL) [contains benzalkonium chloride]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Optipranolol)

0.3% (5): $25.99

0.3% (10): $42.99

Mechanism of ActionBeta-adrenoceptor-blocking agent; lacks intrinsic sympathomimetic activity and membrane-stabilizing effects and possesses only slight local anesthetic activity; mechanism of action of metipranolol in reducing intraocular pressure appears to be via reduced production of aqueous humor. This effect may be related to a reduction in blood flow to the iris root-ciliary body. It remains unclear if the reduction in intraocular pressure observed with beta-blockers is actually secondary to beta-adrenoceptor blockade.

Pharmacodynamics/Kinetics

Onset of action: ≤30 minutes

Peak effect: Maximum: ~2 hours

Duration: Intraocular pressure reduction: Up to 24 hours

Metabolism: Rapid and complete to deacetyl metipranolol, an active metabolite

Half-life elimination: ~3 hours

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentMetipranolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay produce CNS depression; concurrent use with psychotropic agents may produce additive effects

Cardiovascular ConsiderationsIt is important to recognize that metipranolol eye drops may have systemic effects, particularly when patients are also on oral beta-blocker therapy or therapy with other negative chronotropic agents.

Index TermsMetipranolol Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Metoclopramide may be confused with metolazone

Reglan® may be confused with Megace®, Regonol®, Renagel®

Pronunciation(met oh KLOE pra mide)

U.S. Brand NamesReglan®

Canadian Brand NamesApo-Metoclop®; Metoclopramide Hydrochloride Injection; Nu-Metoclopramide

Pharmacologic CategoryAntiemetic; Gastrointestinal Agent, Prokinetic

Use: Labeled Indications

Oral: Symptomatic treatment of diabetic gastric stasis; gastroesophageal reflux

I.V., I.M.: Symptomatic treatment of diabetic gastric stasis; postpyloric placement of enteral feeding tubes; prevention and/or treatment of nausea and vomiting associated with chemotherapy, or postsurgery; to stimulate gastric emptying and intestinal transit of barium during radiological examination

Dosing: Adults

Gastroesophageal reflux: Oral: 10-15 mg/dose up to 4 times/day 30 minutes before meals or food and at bedtime; single doses of 20 mg are occasionally needed for provoking situations. Treatment >12 weeks has not been evaluated.

Diabetic gastric stasis:

Oral: 10 mg 30 minutes before each meal and at bedtime

I.M., I.V. (for severe symptoms): 10 mg over 1-2 minutes; 10 days of I.V. therapy may be necessary for best response

Chemotherapy-induced emesis:

I.V.: 1-2 mg/kg 30 minutes before chemotherapy and repeated every 2 hours for 2 doses, then every 3 hours for 3 doses (manufacturer labeling)

Alternate dosing (with or without diphenhydramine):

Moderate emetic risk chemotherapy: 0.5 mg/kg every 6 hours on days 2-4

Low and minimal risk chemotherapy: 1-2 mg/kg every 3-4 hours

Breakthrough treatment: 1-2 mg/kg every 3-4 hours

Oral (unlabeled use; with or without diphenhydramine):

Moderate emetic risk chemotherapy: 0.5 mg/kg every 6 hours or 20 mg 4 times/day on days 2-4

Low and minimal risk chemotherapy: 20-40 mg every 4-6 hours

Breakthrough treatment: 20-40 mg every 4-6 hours

Postoperative nausea and vomiting: I.M., I.V.: 10-20 mg near end of surgery

Postpyloric feeding tube placement, radiological exam: I.V.: 10 mg

Dosing: Elderly

Gastroesophageal reflux: Oral: 5 mg 4 times/day (30 minutes before meals or food and at bedtime); increase dose to 10 mg 4 times/day if no response at lower dose

Gastrointestinal hypomotility:

Oral: Initial: 5 mg 30 minutes before meals and at bedtime; increase if necessary to 10 mg doses

I.V.: Initiate at 5 mg over 1-2 minutes; increase to 10 mg if necessary

Postoperative nausea and vomiting: I.M., I.V.: 5 mg near end of surgery; may repeat dose if necessary

Dosing: Pediatric

Gastroesophageal reflux (unlabeled use): Oral: 0.1-0.2 mg/kg/dose 4 times/day

Chemotherapy-induced emesis (unlabeled use): I.V.: 1-2 mg/kg 30 minutes before chemotherapy and every 2-4 hours

Postpyloric feeding tube placement: I.V.:

<6 years: 0.1 mg/kg

6-14 years: 2.5-5 mg

>14 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <40 mL/minute: Administer 50% of normal dose.

Not dialyzable (0% to 5%); supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.May be administered I.M.

Administration: I.V.Injection solution may be given I.M., direct I.V. push, short infusion (15-30 minutes), or continuous infusion; lower doses (≤10 mg) of metoclopramide can be given I.V. push undiluted over 1-2 minutes; higher doses to be given IVPB over at least 15 minutes; continuous SubQ infusion and rectal administration have been reported. **Note:** Rapid I.V. administration may be associated with a transient (but intense) feeling of anxiety and restlessness, followed by drowsiness.

Administration: I.V. DetailpH: 3.0-6.5

Administration: OtherContinuous SubQ infusion and rectal administration have been reported

Storage

Injection: Store intact vial at controlled room temperature; injection is photosensitive and should be protected from light during storage; parenteral admixtures in D_5W or NS are stable for at least 24 hours and do not require light protection if used within 24 hours.

Tablet: Store at controlled room temperature.

CompatibilityStable in $D_5{}^1/_2NS$, D_5W, mannitol 20%, LR, NS; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Acyclovir, aldesleukin, amifostine, aztreonam, bleomycin, ciprofloxacin, cisatracurium, cisplatin, cladribine, clarithromycin, cyclophosphamide, cytarabine, diltiazem, docetaxel, doxorubicin, droperidol, etoposide phosphate, famotidine, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, idarubicin, leucovorin, levofloxacin, linezolid, melphalan, meperidine, meropenem, methotrexate, mitomycin, morphine, ondansetron, paclitaxel, piperacillin/tazobactam, remifentanil, sargramostim, sufentanil, tacrolimus, teniposide, thiotepa, topotecan, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, amsacrine, cefepime, doxorubicin liposome, furosemide, propofol. **Variable (consult detailed reference):** TPN.

Compatibility in syringe: Compatible: Aminophylline, ascorbic acid injection, atropine, benztropine, bleomycin, butorphanol, chlorpromazine, cisplatin, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, diamorphine, dimenhydrinate, diphenhydramine, doxorubicin, droperidol, fentanyl, fluorouracil, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydroxyzine, insulin (regular), leucovorin, lidocaine, magnesium sulfate, meperidine, methotrimeprazine, methylprednisolone sodium succinate, midazolam, mitomycin, morphine, ondansetron, pentazocine, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine, scopolamine, sufentanil, vinblastine, vincristine, vitamin B complex with C. **Incompatible:** Ampicillin, calcium gluconate, chloramphenicol, furosemide, penicillin G potassium, sodium bicarbonate. **Variable (consult detailed reference):** Methotrexate.

Compatibility when admixed: Compatible: Cimetidine, clindamycin, diamorphine, meperidine, meropenem, morphine, multivitamins, potassium acetate, potassium chloride, potassium phosphate, verapamil. **Incompatible:** Dexamethasone sodium phosphate with lorazepam and diphenhydramine, erythromycin lactobionate, floxacillin, fluorouracil, furosemide.

ContraindicationsHypersensitivity to metoclopramide or any component of the formulation; GI obstruction, perforation or hemorrhage; pheochromocytoma; history of seizures

Warnings/Precautions

Concerns related to adverse effects:

- Depression: Mental depression has occurred, symptoms range from mild to severe (suicidal ideation and suicide); use with caution in patients with a history of mental illness.

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is higher in pediatric patients and adults <30 years of age). Typically occurs within the initial 24-48 hours of treatment; risk is increased at higher dosages. Use caution with concurrent use of other drugs associated with EPS.

- Neuroleptic malignant syndrome (NMS): Use may be associated (rarely) with neuroleptic malignant syndrome (NMS); monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

Disease-related concerns:

- Edematous conditions: Use with caution in patients who are at risk of fluid overload (HF, cirrhosis). May cause transient increase in serum aldosterone; use lowest recommended doses initially.

- Hypertension: Use with caution in patients with hypertension.
- NADH-cytochrome b5 reductase deficiency: Patients with NADH-cytochrome b5 reductase deficiency are at increased risk of methemoglobinemia and/or sulfhemoglobinemia.
- Parkinson's disease: Use with caution in patients with parkinson's disease; may have increased risk of tardive dyskinesia.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment may be needed.
- Surgical anastomosis/closure: Use with caution following surgical anastomosis/closure; promotility agents may theoretically increase pressure in suture lines.

Special populations:

- Elderly: Use with caution in the elderly; may have increased risk of tardive dyskinesia.

Other warnings/precautions:

- Discontinuation of therapy: Abrupt discontinuation may (rarely) result in withdrawal symptoms (dizziness, headache, nervousness).

Geriatric ConsiderationsElderly are more likely to develop tardive dyskinesia syndrome (especially elderly females) reactions than younger adults. Use lowest recommended doses initially. Must consider renal function (estimate creatinine clearance). It is recommended to do involuntary movement assessments on elderly using this medication at high doses and for long-term therapy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsCrosses the placenta; available evidence suggests safe use during pregnancy.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsEnters breast milk; may increase milk production

Adverse ReactionsFrequency not always defined.

Cardiovascular: AV block, bradycardia, CHF, fluid retention, flushing (following high I.V. doses), hyper-/hypotension, supraventricular tachycardia

Central nervous system: Drowsiness (~10% to 70%; dose related), acute dystonic reactions (<1% to 25%; dose and age related), fatigue (~10%), restlessness (~10%), akathisia, confusion, depression, dizziness, hallucinations (rare), headache, insomnia, neuroleptic malignant syndrome (rare), Parkinsonian-like symptoms, suicidal ideation, seizure, tardive dyskinesia

Dermatologic: Angioneurotic edema (rare), rash, urticaria

Endocrine & metabolic: Amenorrhea, galactorrhea, gynecomastia, impotence

Gastrointestinal: Diarrhea, nausea

Genitourinary: Incontinence, urinary frequency

Hematologic: Agranulocytosis, leukopenia, neutropenia, porphyria

Hepatic: Hepatotoxicity (rare)

Ocular: Visual disturbance

Respiratory: Bronchospasm, laryngeal edema (rare)

Miscellaneous: Allergic reactions, methemoglobinemia, sulfhemoglobinemia

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2D6; **Inhibits** CYP2D6 (weak)

Drug Interactions

Anti-Parkinson's Agents (Dopamine Agonist): Metoclopramide may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

CycloSPORINE: Metoclopramide may increase the absorption of CycloSPORINE. *Risk C: Monitor therapy*

Sertraline: Metoclopramide may enhance the adverse/toxic effect of Sertraline. Specifically, the risk of serotonin syndrome may be increased. *Risk C: Monitor therapy*

Venlafaxine: Metoclopramide may enhance the adverse/toxic effect of Venlafaxine. Specifically, the risk of serotonin syndrome may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Test InteractionsIncreased aminotransferase [ALT/AST] (S), increased amylase (S)

Monitoring ParametersDystonic reactions; signs of hypoglycemia in patients using insulin and those being treated for gastroparesis; agitation, and onfusion

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking (eg, any antipsychotic agents, opioids, anticholinergics). Vital signs should be monitored during intravenous administration. Inpatients should use safety measures (eg, side rails up, call light within reach) and caution patient to call for assistance with ambulation. Assess results of laboratory tests (periodic renal function tests), therapeutic effectiveness (relief of symptoms), and adverse reactions (eg, extrapyramidal effects, parkinsonian-like reactions, seizures, fluid retention, adverse CNS changes). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, CNS restlessness, drowsiness, depression, rash).

Monitoring: Lab TestsPeriodic renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Oral: Take this drug as prescribed, 30 minutes prior to eating. Do not increase dosage. Avoid alcohol; may increase adverse effects. May cause dizziness, drowsiness, or blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known); cause restlessness, anxiety, depression, or insomnia (will reverse when medication is discontinued). Report any CNS changes, spasticity or involuntary movements, unresolved diarrhea, fluid retention (swelling of extremities, weight gain); visual disturbances; palpitations or rapid heart beat; or any other persistent adverse effects. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 5 mg/mL (2 mL)

Reglan®: 5 mg/mL (2 mL, 10 mL, 30 mL)

Solution, oral: 5 mg/5 mL (10 mL, 480 mL)

Tablet: 5 mg, 10 mg

Reglan®: 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Metoclopramide HCl)

5 mg/5 mL (240): $15.99

Tablets (Metoclopramide HCl)

5 mg (30): $12.99

10 mg (90): $15.99

Tablets (Reglan)

5 mg (30): $32.99

10 mg (30): $54.99

Mechanism of ActionBlocks dopamine receptors and (when given in higher doses) also blocks serotonin receptors in chemoreceptor trigger zone of the CNS; enhances the response to acetylcholine of tissue in upper GI tract causing enhanced motility and accelerated gastric emptying without stimulating gastric, biliary, or pancreatic secretions; increases lower esophageal sphincter tone

Pharmacodynamics/Kinetics

Onset of action: Oral: 0.5-1 hour; I.V.: 1-3 minutes; I.M.: 10-15 minutes

Duration: Therapeutic: 1-2 hours, regardless of route

Distribution: V_d: 2-4 L/kg

Protein binding: 30%

Bioavailability: Oral: 65% to 95%

Half-life elimination: Normal renal function: 4-6 hours (may be dose dependent)

Time to peak, serum: Oral: 1-2 hours

Excretion: Urine (~85%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and restlessness are common; may cause insomnia or depression. Depression has occurred in patients with and without a prior history of depression. Symptoms have ranged from mild to severe, and have included suicidal ideation and suicide. Metoclopramide is a D_2 blocker; may cause extrapyramidal symptoms especially when used in high dosages (dystonia) or in the elderly (tardive dyskinesia). Dystonic reactions occur in approximately 1 in 500 patients with the usual adult dosage of 30-40 mg/day. These reactions are usually seen during the first 1-2 days of therapy with metoclopramide, occurring more frequently in pediatric patients and adults <30 years of age, and are more frequent when higher doses are used in prophylaxis of vomiting due to cancer chemotherapy. NMS has rarely been reported.

Mental Health: Effects on Psychiatric TreatmentAnticholinergics may antagonize metoclopramide's effects; concurrent use with psychotropic may produce additive sedation

Cardiovascular ConsiderationsMetoclopramide dose not cause QT prolongation.

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information: The consensus guidelines for postoperative nausea and vomiting (Gan, 2003) does not recommend the use of metoclopramide.

Medication Safety Issues

Sound-alike/look-alike issues:

Metolazone may be confused with metaxalone, methazolamide, methimazole, methotrexate, metoclopramide, metoprolol, minoxidil

Zaroxolyn® may be confused with Zarontin®

Pronunciation(me TOLE a zone)

U.S. Brand NamesZaroxolyn®

Canadian Brand NamesZaroxolyn®

Pharmacologic CategoryDiuretic, Thiazide-Related

Use: Labeled IndicationsManagement of mild to moderate hypertension; treatment of edema in congestive heart failure and nephrotic syndrome, impaired renal function

Dosing: Adults

Edema: Oral: 2.5-20 mg/dose every 24 hours (ACC/AHA 2005 Heart Failure Guidelines)

Hypertension: Oral: 2.5-5 mg/dose every 24 hours

Dosing: ElderlyOral: Initial: 2.5 mg/day or every other day

Dosing: Renal ImpairmentNot dialyzable (0% to 5%) via hemo- or peritoneal dialysis; supplemental dose is not necessary

Administration: OralMay be taken with food or milk. Take early in day to avoid nocturia. Take the last dose of multiple doses no later than 6 PM unless instructed otherwise.

Dietary ConsiderationsShould be taken after breakfast; may require potassium supplementation

Extemporaneously Prepared

A 1 mg/mL suspension may be made by crushing twelve 10 mg Zaroxolyn® tablets; add Ora-Sweet®, Ora-Sweet® SF, Ora-Plus®, or cherry syrup diluted 1:4 with simple syrup to total volume of 120 mL. Label “shake well”; stable 60 days refrigerated.

A 0.25 mg/mL suspension may be made by crushing one 2.5 mg tablet; add 1:1 mixture 1% methylcellulose:simple syrup mixture to a total volume of 10 mL; label "shake well"; refrigerate; stable 91 days refrigerated; 28 days at room temperature in plastic and 14 days at room temperature in glass.

Nahata, MC, Pai VB, and Hipple TF, *Pediatric Drug Formulations*, 5th ed, Cincinnati, OH: Harvey Whitney Books Co, 2004.

ContraindicationsHypersensitivity to metolazone, any component of the formulation, other thiazides, and sulfonamide derivatives; anuria; hepatic coma; pregnancy (expert analysis)

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with thiazide or sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations.
- Hypokalemia: Use with caution in patients with hypokalemia; correct before initiating therapy.

- Renal impairment: Avoid in severe renal disease (ineffective).

- Systemic lupus erythematosus (SLE): Can cause SLE exacerbation or activation.

Concurrent drug therapy issues:

- Furosemide: Large or prolonged fluid and electrolyte losses may occur with concomitant furosemide administration.

Geriatric ConsiderationsWhen metolazone is used in combination with other diuretics, there is an increased risk of azotemia and electrolyte depletion, particularly in the elderly, monitor closely. May be effective in patients with glomerular filtration rate <20 mL/minute. Metolazone is often used in combination with a loop diuretic in patients who are unresponsive to the loop diuretic alone.

Pregnancy Risk FactorB (manufacturer); D (expert analysis)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Metolazone crosses the placenta and appears in cord blood. Hypoglycemia, hypokalemia, hyponatremia, jaundice, and thrombocytopenia are reported as complications to the fetus or newborn following maternal use of thiazide diuretics.

LactationEnters breast milk/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Chest pain/discomfort, necrotizing angiitis, orthostatic hypotension, palpitation, syncope, venous thrombosis, vertigo, volume depletion

Central nervous system: chills, depression, dizziness, drowsiness, fatigue, headache, lightheadedness, restlessness

Dermatologic: Petechiae, photosensitivity, pruritus, purpura, rash, skin necrosis, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Gout attacks, hypercalcemia, hyperglycemia, hyperuricemia, hypochloremia, hypochloremic alkalosis, hypokalemia, hypomagnesemia, hyponatremia, hypophosphatemia

Gastrointestinal: Abdominal bloating, abdominal pain, anorexia, constipation, diarrhea, epigastric distress, nausea, pancreatitis, vomiting, xerostomia

Genitourinary: Impotence

Hematologic: Agranulocytosis, aplastic/hypoplastic anemia, hemoconcentration, leukopenia, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatitis

Neuromuscular & skeletal: Joint pain, muscle cramps/spasm, neuropathy, paresthesia, weakness

Ocular: Blurred vision (transient)

Renal: BUN increased, glucosuria

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: May potentiate hypotensive effect of metazolone.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid dong quai, St John's wort (may also cause photosensitization). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid natural licorice. Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersSerum electrolytes (potassium, sodium, chloride, bicarbonate), renal function, blood pressure (standing, sitting/supine)

Nursing: Physical Assessment/MonitoringEvaluate patient's renal status and allergy history (thiazides and sulfonamide derivatives) prior to beginning therapy. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, especially anything that will affect blood pressure). Assess electrolytes and renal function, therapeutic effectiveness, and adverse reactions (eg, hypersensitivity reactions, electrolyte imbalance, hypotension) on a regular basis during therapy. Caution patients with diabetes (may see a change in glucose control). Teach patient proper use, possible side effects/appropriate interventions (eg, orthostatic hypotension precautions), and adverse symptoms to report.

Monitoring: Lab TestsSerum electrolytes (potassium, sodium, chloride, bicarbonate), renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed, after breakfast. Include bananas or orange juice in daily diet but do not take potassium supplements without advice of prescriber. This medication does not replace other antihypertensive interventions; follow prescriber's instructions for diet and lifestyle changes. Weigh yourself weekly at the same time, in the same clothes. Report weight gain >5 lb/week. May cause dizziness or weakness (change position slowly when rising from sitting or lying, avoid driving or tasks requiring alertness until response to drug is known); nausea or loss of appetite (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); impotence (reversible); constipation (increased exercise, fluids, fruit, or fiber may help); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report chest pain, palpitations; acute dizziness; flu-like symptoms; headache; joint soreness, pain, or weakness; respiratory difficulty; skin rash; excessive fatigue; swelling of extremities; unresolved gastrointestinal upset (pain, constipation, diarrhea, nausea, vomiting, change in appetite); or other persistent adverse reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 2.5 mg, 5 mg, 10 mg

Zaroxolyn®: 2.5 mg, 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Metolazone)

2.5 mg (30): $42.99

5 mg (30): $37.37

Tablets (Zaroxolyn)

2.5 mg (30): $64.84

5 mg (30): $69.47

10 mg (30): $63.47

Mechanism of ActionInhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water, as well as, potassium and hydrogen ions

Pharmacodynamics/Kinetics

Onset of action: Diuresis: ~60 minutes

Duration: ≥24 hours

Absorption: Incomplete

Distribution: Crosses placenta; enters breast milk

Protein binding: 95%

Half-life elimination: 20 hours

Excretion: Urine (80%); bile (10%)

Related Information

- Heart Failure (Systolic)
- Sulfonamide Derivatives

Pharmacotherapy PearlsMetolazone 5 mg is approximately equivalent to hydrochlorothiazide 50 mg.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes

upon discontinuation) and orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsMetolazone is a potent diuretic and is often used in patients refractory to thiazide or loop diuretics. It is important that the patient be closely monitored to avoid profound volume depletion. Also watch for hypomagnesemia.

Anesthesia and Critical Care Concerns/Other ConsiderationsMetolazone 5 mg is approximately equivalent to hydrochlorothiazide 50 mg. When taken the day of surgery, it may cause hypovolemia and the hypertensive patient undergoing general anesthesia to have labile blood pressure; use with caution prior to surgery or perioperatively

Metolazone is a potent diuretic and is often used in patients refractory to thiazide or loop diuretics. It is important that the patient be closely monitored to avoid profound volume depletion. Also watch for hypomagnesemia.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(me toe PROE lole & hye droe klor oh THYE a zide)

U.S. Brand NamesLopressor HCT®

Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension (not recommended for initial treatment)

Dosing: AdultsHypertension: Oral: Dosage should be determined by titration of the individual agents and the combination product substituted based upon the daily requirements.

Usual dose: Metoprolol 50-100 mg and hydrochlorothiazide 25-50 mg administered daily as single or divided doses (twice daily)

> **Note:** Hydrochlorothiazide >50 mg/day is not recommended.

Concomitant therapy: It is recommended that if an additional antihypertensive agent is required, gradual titration should occur using $^1/_2$ the usual starting dose of the other agent to avoid hypotension.

Dosing: ElderlyRefer to adult dosing.

Administration: OralAdminister with or immediately following meals (or as directed). To avoid nocturia, doses should be taken early in the day and last dose of multiple doses should be taken no later than 6 pm.

StorageStore at controlled room temperature of 25°C (77°F). Protect from moisture.

ContraindicationsHypersensitivity to metoprolol, hydrochlorothiazide, sulfonamide-derived drugs or any component of the formulation; sick sinus syndrome, sinus bradycardia, heart block (greater than first degree), cardiogenic shock, overt cardiac failure; severe peripheral arterial disease; pheochromocytoma (without alpha blockade); anuria

Allergy Considerations

- Beta-Blocker Allergy
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Abrupt withdrawal: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.
- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur with hydrochlorothiazide.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; however, metoprolol, with B$_1$ selectivity, has been used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating metoprolol.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Heart failure: Use metoprolol with caution in patients with compensated heart failure and monitor for a worsening of the condition (only the extended release product is indicated for heart failure).
- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Myasthenia gravis: Use metoprolol with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): Use metoprolol with caution in patients with PVD (including Raynaud's).

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use metoprolol with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal impairment: Avoid hydrochlorothiazide in severe renal disease (ineffective).

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

- Thyrotoxicosis: Beta-blockade may mask signs of hyperthyroidism (eg, tachycardia). Abrupt discontinuation of beta-blockade may exacerbate symptoms of hyperthyroidism and may also induce thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents (eg, ether, cyclopropane and trichloroethylene) which decrease myocardial function.

- Calcium channel blockers (nondihydropyridines): Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: **[U.S. Boxed Warning]: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered over 1-2 weeks to avoid acute tachycardia, hypertension, and/or ischemia.**

- Appropriate use: Used as a replacement for separate dosing of components or combination when response to single agent is suboptimal; the fixed combination is not indicated for initial treatment of hypertension.

Geriatric ConsiderationsSee individual agents.

Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsReactions noted here have been reported with the combination product; see individual drug monographs for additional adverse reactions that may be expected from each agent.

1% to 10%:

Cardiovascular: Bradycardia (6%), edema (1%)

Central nervous system: Fatigue (10%), dizziness (10%), drowsiness (10%), headache (10%), vertigo (10%), abnormal dreams (1%)

Dermatologic: Purpura (1%)

Endocrine & metabolic: Hypokalemia (<10%), gout (1%)

Gastrointestinal: Anorexia (1%), constipation (1%), diarrhea (1%), nausea (1%), vomiting (1%), xerostomia (1%)

Genitourinary: Impotence (1%)

Neuromuscular & skeletal: Myalgia (1%)

Ocular: Blurred vision (1%)

Otic: Earache (1%), tinnitus (1%)

Respiratory: Dyspnea (1%)

Miscellaneous: Flu-like syndrome (10%), diaphoresis (1%), exercise tolerance decreased (1%)

Metabolism/Transport EffectsMetoprolol: **Substrate** of CYP2C19 (minor), 2D6 (major); Inhibits CYP2D6 (weak)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor*

therapy

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.
Test InteractionsSee individual agents.
Monitoring ParametersWeight, I & O; blood pressure, heart rate; serum electrolytes, BUN, creatinine
Monitoring: Lab TestsSerum electrolytes, BUN, creatinine
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

50/25: Metoprolol tartrate 50 mg and hydrochlorothiazide 25 mg

100/25: Metoprolol tartrate 100 mg and hydrochlorothiazide 25 mg

100/50: Metoprolol tartrate 100 mg and hydrochlorothiazide 50 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Lopressor HCT)

50-25 mg (60): $109.88

100-25 mg (30): $57.56

100-50 mg (30): $81.99

Mechanism of ActionSee individual agents.
Pharmacodynamics/KineticsSee individual agents.
Pharmacotherapy PearlsA loss of B_1 selectivity is associated with increased doses of metoprolol.
Dental Health: Effects on Dental Treatment

Metoprolol: Metoprolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with metoprolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for metoprolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Hydrochlorothiazide: Key adverse event(s) related to dental treatment: Orthostatic hypotension and hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, or abnormal dreams
Mental Health: Effects on Psychiatric TreatmentHydrochlorothiazide decreases lithium clearance resulting in an increase in serum lithium levels and potential for lithium toxicity; monitor lithium levels. Beta-blockers may increase the effects of psychotropics; monitor clinical status for potential changes.
Index TermsHydrochlorothiazide and Metoprolol; Hydrochlorothiazide and Metoprolol Tartrate; Metoprolol Tartrate and Hydrochlorothiazide

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lopressor® may be confused with Lyrica®

Metoprolol may be confused with metaproterenol, metolazone, misoprostol

Toprol-XL® may be confused with Tegretol®, Tegretol®-XR, Topamax®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

Pronunciation(me toe PROE lole)

U.S. Brand NamesLopressor®; Toprol-XL®

Canadian Brand NamesApo-Metoprolol®; Betaloc®; Betaloc® Durules®; Dom-Metoprolol; Gen-Metoprolol; Lopressor®; Metoprolol Tartrate Injection, USP; Metoprolol-25; Novo-Metoprolol; Nu-Metop; PHL-Metoprolol; PMS-Metoprolol; RIVA-Metoprolol ; Sandoz-Metoprolol; Toprol-XL®

Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective

Use: Labeled IndicationsTreatment of angina pectoris, hypertension, or hemodynamically-stable acute myocardial infarction

Extended release: Treatment of angina pectoris or hypertension; to reduce mortality/hospitalization in patients with heart failure (stable NYHA Class II or III) already receiving ACE inhibitors, diuretics, and/or digoxin

Use: Unlabeled/InvestigationalTreatment of ventricular arrhythmias, atrial ectopy; migraine prophylaxis, essential tremor, aggressive behavior (not recommended for dementia-associated aggression); prevention of myocardial infarction, atrial fibrillation, and atrial flutter; symptomatic treatment of hypertrophic obstructive cardiomyopathy

Dosing: Adults

Hypertension: Oral: 100-450 mg/day in 2-3 divided doses, begin with 50 mg twice daily and increase doses at weekly intervals to desired effect; usual dosage range (JNC 7): 50-100 mg/day

Extended release: Initial: 25-100 mg/day (maximum: 400 mg/day)

Angina, SVT, MI prophylaxis: Oral: 100-450 mg/day in 2-3 divided doses, begin with 50 mg twice daily and increase doses at weekly intervals to desired effect

Extended release: Initial: 100 mg/day (maximum: 400 mg/day)

Hypertension/ventricular rate control: I.V. (in patients having nonfunctioning GI tract): Initial: 1.25-5 mg every 6-12 hours; titrate initial dose to response. Initially, low doses may be appropriate to establish response; however, up to 15 mg every 3-6 hours has been employed.

Congestive heart failure: Oral (extended release): Initial: 25 mg once daily (reduce to 12.5 mg once daily in NYHA class higher than class II); may double dosage every 2 weeks as tolerated (maximum: 200 mg/day)

Myocardial infarction (acute): I.V.: 5 mg every 2 minutes for 3 doses in early treatment of myocardial infarction; thereafter give 50 mg orally every 6 hours 15 minutes after last I.V. dose and continue for 48 hours; then administer a maintenance dose of 100 mg twice daily.

Note: Switching dosage forms:

When switching from immediate release metoprolol to extended release, the same total daily dose of metoprolol should be used.

When switching between oral and intravenous dosage forms, equivalent beta-blocking effect is achieved when doses in a 2.5:1 (Oral:I.V.) ratio is used.

Dosing: ElderlyRefer to adult dosing. Select dose cautiously, starting at the lower end of the dosing range.

Dosing: Pediatric

Hypertension: Oral:

Immediate release tablet: Children: 1-17 years (National High Blood Pressure Education Program Working Group on High Blood Pressure in Children and Adolescents, 2004): Initial: 1-2 mg/kg/day; maximum 6 mg/kg/day (≤200 mg/day); administer in 2 divided doses

Extended release tablet: Children ≥6 years: Initial: 1 mg/kg once daily (maximum initial dose: 50 mg/day). Adjust dose based on patient response (maximum: 2 mg/kg/day or 200 mg/day)

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic ImpairmentReduced dose may be necessary.

Administration: I.V.When administered acutely for cardiac treatment, monitor ECG and blood pressure. May administer by rapid infusion (I.V. push) over 1 minute or by slow infusion (ie, 5-10 mg of metoprolol in 50 mL of fluid) over ~30 minutes. Necessary monitoring for surgical patients who are unable to take oral beta-blockers (prolonged ileus) has not been defined. Some institutions require monitoring of baseline and postinfusion heart rate and blood pressure when a patient's response to beta-blockade has not been characterized (ie, the patient's initial dose or following a change in dose). Consult individual institutional policies and procedures.

Administration: I.V. DetailpH: 7.5

Administration: OralExtended release tablets may be divided in half; do not crush or chew.

Dietary ConsiderationsRegular tablets should be taken with food. Extended release tablets may be taken without regard to meals.

Storage

Injection: Store at controlled room temperature of 25°C (77°F). Protect from light.

Tablet: Store at controlled room temperature of 25°C (77°F). Protect from moisture.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Alteplase, meperidine, morphine. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Extemporaneously PreparedTo prepare a metoprolol 10 mg/mL liquid, crush 12 metoprolol tartrate 100 mg tablets into a fine powder. Add ~20 mL of either Ora-Sweet® and Ora-Plus® (1:1 preparation), or Ora-Sweet® SF and Ora-Plus® (1:1 preparation), or cherry syrup. Mix to a uniform paste. Continue to add the vehicle to bring the final volume to 120 mL. The preparation is stable for 60 days; shake well before using and protect from light.

> Allen LV and Erickson III MA, "Stability of Labetalol Hydrochloride, Metoprolol Tartrate, Verapamil Hydrochloride, and Spironolactone With Hydrochlorothiazide in Extemporaneously Compounded Oral Liquids," *Am J Health Syst Pharm*, 1996, 53:2304-9.

Contraindications**Note:** Contraindications are indication-specific.

Hypersensitivity to metoprolol, any component of the formulation, or other beta-blockers; additionally:

> **Hypertension and angina:** Sick sinus syndrome (except in patients with a functioning artificial pacemaker); severe peripheral arterial disease; pheochromocytoma (without alpha blockade)
>
> **Myocardial infarction:** Severe sinus bradycardia (heart rate <45 beats/minute); significant first-degree heart block (P-R interval ≥0.24 seconds); second- and third-degree heart block; systolic blood pressure <100 mm Hg; moderate-to-severe cardiac failure; cardiogenic shock

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Boxed warnings:

- Abrupt withdrawal: See "Other warnings/precautions" below.

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated allergen challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

- Atrioventricular (AV) block: Metoprolol commonly produces mild first-degree heart block (P-R interval >0.2-0.24 sec). Metoprolol may also produce severe first- (P-R interval ≥0.26 sec), second-, or third-degree heart block. Patients with acute myocardial infarction (especially right ventricular myocardial infarction) have a high risk of developing heart block of varying degrees. If severe heart block occurs, metoprolol should be discontinued and measures to increase heart rate should be employed.

- Hypotension: Symptomatic hypotension may occur with use.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; however, metoprolol, with B_1 selectivity, has been used cautiously with close monitoring.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.

- Heart failure: Use with caution in patients with compensated heart failure; monitor for a worsening of heart failure (only the extended release product is indicated for use in heart failure).

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Thyrotoxicosis: Beta-blockade may mask signs of hyperthyroidism (eg, tachycardia). Abrupt discontinuation of beta-blockade may exacerbate symptoms of hyperthyroidism and may also induce thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving inhalation anesthetic agents which may decrease myocardial function.

- Calcium channel blockers (nondihydropyridines): Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur. Avoid concurrent I.V. use of both agents.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Dosage form specific issues:

- Extended release: Use care in compensated heart failure and monitor closely for a worsening of the condition. May need to increase diuretics and wait until clinically stable to advance dose to target.

Other warnings/precautions:

- Abrupt withdrawal: **[U.S. Boxed Warning]: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered over 1-2 weeks to avoid acute tachycardia, hypertension, and/or ischemia.**

Geriatric Considerations Due to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in the elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk Factor C (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy Considerations Teratogenic effects were not observed in animal studies. Metoprolol crosses the placenta. Maternal use of beta-blockers has been associated with fetal bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7). Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition. Information specific to metoprolol is limited.

Lactation Enters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding Considerations Metoprolol is considered compatible by the AAP. However, monitor the infant for signs of beta-blockade (hypotension, bradycardia, etc) with long-term use.

Adverse Reactions Frequency may not be defined.

Cardiovascular: Hypotension (1% to 27%), bradycardia (2% to 16%), first-degree heart block (P-R interval ≥0.26 sec; 5%), arterial insufficiency (usually Raynaud type; 1%), chest pain (1%), CHF (1%), edema (peripheral; 1%), palpitation (1%), syncope (1%)

Central nervous system: Dizziness (2% to 10%), fatigue (1% to 10%), depression (5%), confusion, hallucinations, headache, insomnia, memory loss (short-term), nightmares, sleep disturbances, somnolence, vertigo

Dermatology: Pruritus (5%), rash (5%), photosensitivity, psoriasis exacerbated

Endocrine & metabolic: Libido decreased, Peyronie’s disease (<1%), diabetes exacerbated

Gastrointestinal: Diarrhea (5%), constipation (1%), flatulence (1%), gastrointestinal pain (1%), heartburn (1%), nausea (1%), xerostomia (1%), vomiting

Hematologic: Claudication

Neuromuscular & skeletal: Musculoskeletal pain

Ocular: Blurred vision, visual disturbances

Otic: Tinnitus

Respiratory: Dyspnea (1% to 3%), bronchospasm (1%), wheezing (1%), rhinitis

Miscellaneous: Cold extremities (1%)

Postmarketing and/or case reports: Agranulocytosis, alkaline phosphatase increased, alopecia (reversible), arthralgia, arthritis, anxiety, cardiogenic shock, diaphoresis increased, dry eyes, gangrene, hepatitis, HDL decreased, impotence, jaundice, lactate dehydrogenase increased, nervousness, paresthesia, retroperitoneal fibrosis, second-degree heart block, taste disturbance, third-degree heart block, thrombocytopenia, transaminases increased, triglycerides increased, urticaria, vomiting, weight gain

Other events reported with beta-blockers: Catatonia, emotional lability, fever, hypersensitivity reactions, laryngospasm, nonthrombocytopenic purpura, respiratory distress, thrombocytopenic purpura

Metabolism/Transport Effects **Substrate** of CYP2C19 (minor), 2D6 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Food increases absorption. Metoprolol serum levels may be increased if taken with food.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), gotu kola, licorice, (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersAcute cardiac treatment: Monitor ECG and blood pressure with I.V. administration; heart rate and blood pressure with oral administration

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. **I.V.:** See Administration specifics and monitor blood pressure and cardiac status. Assess therapeutic effectiveness and adverse reactions (eg, fluid balance, CHF, postural hypotension). Caution patients with diabetes to monitor serum glucose closely; may decrease the effect of sulfonylureas and can mask prominent hypoglycemic symptoms. Teach patient proper use (oral), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationI.V. use in emergency situations: Patient information is appropriate to patient condition.

Oral: Do not take any new medication during therapy unless approved by prescriber. Take exactly as directed. Do not change dosage or discontinue without consulting prescriber. Take pulse daily, prior to medication and follow prescriber's instruction about holding medication. Do not take with antacids. If you have diabetes, monitor blood glucose closely (drug may alter glucose tolerance or mask signs of hypoglycemia). May cause fatigue, dizziness, or postural hypotension (use caution when changing position from lying or sitting to standing, when driving, or when climbing stairs until response to medication is known); or alteration in sexual performance (reversible). Report unresolved swelling of extremities, respiratory difficulty or new cough, unresolved fatigue, unusual weight gain, unresolved constipation, or unusual muscle weakness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as tartrate: 1 mg/mL (5 mL)

Lopressor®: 1 mg/mL (5 mL)

Tablet, as tartrate: 25 mg, 50 mg, 100 mg

Lopressor®: 50 mg, 100 mg

Tablet, extended release, as succinate: 25 mg, 50 mg, 100 mg, 200 mg [expressed as mg equivalent to tartrate]

Toprol-XL®: 25 mg, 50 mg, 100 mg, 200 mg [expressed as mg equivalent to tartrate]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Metoprolol Succinate)

25 mg (30): $29.99

50 mg (30): $33.88

200 mg (90): $204.58

Tablet, 24-hour (Toprol XL)

25 mg (30): $39.99

50 mg (30): $39.99

100 mg (30): $52.99

200 mg (90): $231.48

Tablets (Lopressor)

50 mg (60): $100.00

100 mg (60): $136.20

Tablets (Metoprolol Tartrate)

25 mg (30): $12.99

100 mg (60): $15.99

Mechanism of ActionSelective inhibitor of beta$_1$-adrenergic receptors; competitively blocks beta$_1$-receptors, with little or no effect on beta$_2$-receptors at doses <100 mg; does not exhibit any membrane stabilizing or intrinsic sympathomimetic activity

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Oral: 1.5-4 hours; I.V.: 20 minutes (when infused over 10 minutes)

Duration: Oral: Immediate release: 10-20 hours, Extended release: ~24 hours; I.V.: 5-8 hours

Absorption: 95%, rapid and complete

Protein binding: 12% to albumin

Metabolism: Extensively hepatic via CYP2D6; significant first-pass effect (~50%)

Bioavailability: Oral: ~50%

Half-life elimination: 3-8 hours (dependent on rate of CYP2D6 metabolism)

Excretion: Urine (<5% to 10% as unchanged drug)

Related Information

- Antiarrhythmic Drugs
- Beta-Blockers

Dental Health: Effects on Dental TreatmentMetoprolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with metoprolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for metoprolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation and dizziness are common; may cause depression; may rarely cause insomnia, confusion, amnesia, or nightmares

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the effects of metoprolol; beta-blockers may increase the effects of psychotropics; monitor clinical status for potential changes

Cardiovascular Considerations

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation.

Chronic Stable Angina: Beta-blockers are effective in the treatment of angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina.

Heart Failure: Strong evidence supports that beta-blocker therapy, without intrinsic sympathomimetic activity (ISA), should be initiated in select patients with **stable** congestive heart failure (NYHA Class II-III). To date, carvedilol, sustained release metoprolol, and bisoprolol have demonstrated a beneficial effect on morbidity and mortality. It is important that beta-blocker therapy be instituted initially at very low doses with gradual and very careful titration.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists that requires the use of other drugs, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Neurocardiogenic Syncope: Metoprolol has also been used in the treatment of neurocardiogenic (vasovagal) syncope.

ST-Segment Elevation Myocardial Infarction (STEMI): Beta-blockers, without intrinsic sympathomimetic activity (ISA), have been shown to decrease morbidity and mortality when initiated in the acute treatment of STEMI and continued long-term. Oral beta-blockade should be initiated promptly in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade may be considered and given promptly if the patient is experiencing concomitant hypertension unless any of the aforementioned contraindications exist (Class IIa recommendation). Patients at risk of cardiogenic shock include patients with age >70 years, systolic blood pressure <120 mm Hg, heart rate >110 bpm or <60 bpm, or late presentation.

Unstable Angina/Non-ST-Segment Elevation MI (UA/NSTEMI): In the treatment of UA/NSTEMI, oral beta-blockade should be initiated within the first 24 hours in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade should only be considered if the patient is experiencing concomitant hypertension upon presentation (Class IIa recommendation).

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul, 2006; POISE Study Group, 2008; Yang, 2006). One such clinical trial randomized 8351 patients with, or at risk of, atherosclerotic disease who underwent noncardiac surgery to either extended release metoprolol succinate or placebo. To receive study drug, first dose (metoprolol extended release 100 mg or matching placebo) administered 2-4 hours prior to surgery, patients were to have a heart rate ≥50 bpm or systolic blood pressure (SBP) ≥100 mm Hg. If during the first 6 hours after surgery heart rate was ≥80 bpm and SBP ≥100 mm Hg, the first postoperative dose (metoprolol extended release 100 mg or matching placebo) was administered. If not given during the first 6 hours, metoprolol extended release 100 mg (or matching placebo) was administered at 6 hours after surgery. Twelve hours after administration of the first postoperative dose, metoprolol extended release 200 mg (or matching placebo) was administered once daily for 30 days. Therefore, patients may have received up to 400 mg during the first 24 hours; an initial dose not recommended for any indication. Study drug was withheld when heart rate was consistently <45 bpm or systolic blood pressure was <100 mm Hg. The primary outcome of the trial was a composite of cardiovascular death, nonfatal MI, and nonfatal cardiac arrest at 30 days after randomization. Compared to those who received placebo, fewer patients receiving metoprolol experienced the primary outcome (244 [5.8%] vs 290 [6.9%], p=0.0399) or developed MI (176 [4.2%] vs 239 [5.7%], p=0.0017). However, more deaths occurred in the metoprolol group compared to placebo (129 [3.1%] vs 97 [2.3%], p=0.0317). In addition, more strokes occurred in the metoprolol group compared to placebo (41 [1%] vs 19 [0.5%], p=0.0053). Death was associated with a number of risk factors (eg, clinically significant hypotension, MI, significant bleeding). Stroke was associated with history of stroke or TIA, postoperative hypotension, new-onset atrial fibrillation, and significant bleeding (POISE Study Group, 2008). The negative results of this trial are thought to be due to the aggressive administration of metoprolol leading to an excessive amount of clinically significant hypotension which then contributed to the incidence of stroke and mortality. Therefore, when administering beta-blockers to eligible patients undergoing elective surgery, patients should be titrated days to weeks in advance when possible and careful monitoring of heart rate (goal <65 bpm) and blood pressure is necessary.

Extemporaneously Prepared: To prepare a metoprolol 10 mg/mL liquid, crush 12 metoprolol tartrate 100 mg tablets into a fine powder. Add ~20 mL of either Ora-Sweet® and Ora-Plus® (1:1 preparation), or Ora-Sweet® SF and Ora-Plus® (1:1 preparation), or cherry syrup. Mix to a uniform paste. Continue to add the vehicle to bring the final volume to 120 mL. The preparation is stable for 60 days; shake well before using and protect from light.

Index Terms

Metoprolol Succinate; Metoprolol Tartrate

Metronidazole and Nystatin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(met roe NYE da zole & nye STAT in)

Canadian Brand NamesFlagystatin®

Pharmacologic CategoryAntifungal Agent, Vaginal; Antiprotozoal, Nitroimidazole

Use: Labeled IndicationsTreatment of mixed vaginal infection due to *T. vaginalis* and *C. albicans*

Dosing: Adults**Mixed vaginal infection:** Intravaginal:

Vaginal tablet (ovule): Insert 1 tablet/day at bedtime for 10 consecutive days. May repeat for an additional 10 days if cure is not achieved.

Vaginal cream: Insert 1 applicatorful daily at bedtime for 10 consecutive days. May repeat for an additional 10 days if cure is not achieved.

Note: If *Trichomonas vaginalis* is not completely eliminated, oral (systemic) metronidazole (250 mg twice daily for 10 days) should be administered.

Dosing: ElderlyRefer to adult dosing.

StorageVaginal insert: Store in refrigerator. Protect from temperature extremes, moisture, and light.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to metronidazole, nystatin, or any component of the formulation. Combined treatment with oral metronidazole should be avoided in active neurological disorders or in patients with a history of blood dyscrasia, hypothyroidism, or hypoadrenalism (unless the benefits outweigh the possible risk to the patient).

Also refer to Metronidazole monograph.

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.
- Systemic effects: Systemic absorption of metronidazole from vaginal administration may occur. Adverse effects normally associated with systemic administration of metronidazole may occur following the vaginal administration.

Concurrent drug therapy issues:

- Oral metronidazole: Consult additional warnings in Metronidazole monograph when used concurrently with systemic metronidazole (patients should be warned against consuming alcohol due to possible disulfiram-like reaction). No disulfiram-like reactions have been reported after **topical/vaginal** application of metronidazole alone, although metronidazole can be detected in the blood. Oral treatment should be discontinued if ataxia or any other symptom of CNS involvement occurs.

Special populations:

- Sexual partners: Sexual partners should receive concurrent treatment (oral metronidazole) when there is evidence of trichomonal infestation.

Other warnings/precautions:

- Appropriate use: May not be effective in bacterial vaginal infections and should not be prescribed unless there is direct evidence of trichomonal infestation. Nystatin possesses little or no antibacterial activity while metronidazole is selective against certain anaerobic bacteria.

Pregnancy ConsiderationsMetronidazole crosses the placenta. Although it has been given to pregnant women without apparent complication, oral/systemic use should be avoided in pregnant patients and the drug be withheld during the first trimester of pregnancy. Vaginal metronidazole is absorbed systemically in small amounts.

Lactation

Metronidazole: Enters breast milk/not recommended (AAP rates “of concern”)

Nystatin: Does not enter breast milk/compatible

Adverse Reactions**Note:** Adverse effects are infrequent and generally minor.

Central nervous system: Headache

Dermatologic: Pruritus, spots on skin (around knees), welts on body

Gastrointestinal: Coated tongue, nausea, taste disturbance (bitter), vomiting

Genitourinary: Vaginal: Burning, granular sensation

Neuromuscular & skeletal: Fatigue, swelling/aching or wrists

Drug Interactions

Alcohol (Ethyl): MetroNIDAZOLE may enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

Amprenavir: MetroNIDAZOLE may enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. *Risk X: Avoid combination*

Busulfan: MetroNIDAZOLE may increase the serum concentration of Busulfan. *Risk D: Consider therapy modification*

Calcineurin Inhibitors: MetroNIDAZOLE may decrease the metabolism of Calcineurin Inhibitors. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of MetroNIDAZOLE. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mebendazole: May enhance the adverse/toxic effect of MetroNIDAZOLE. Particularly the risk for Stevens-Johnson Syndrome or Toxic Epidermal Necrolysis may be increased. *Risk D: Consider therapy modification*

Mycophenolate: MetroNIDAZOLE may decrease the serum concentration of Mycophenolate. Specifically, metronidazole may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Tipranavir: MetroNIDAZOLE may enhance the adverse/toxic effect of Tipranavir. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): MetroNIDAZOLE may decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Cream, vaginal (Flagystatin®) [CAN]: Metronidazole 500 mg and nystatin 100,000 units per applicatorful (55 g) [packaged with applicator]

Tablet, vaginal (Flagystatin® Ovule) [CAN]: Metronidazole 500 mg and nystatin 100,000 units (10s) [packaged with applicator]

Mechanism of ActionSee individual agents.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

MetroNIDAZOLE may be confused with meropenem, metFORMIN

Pronunciation(met roe NYE da zole)

U.S. Brand NamesFlagyl ER®; Flagyl®; MetroCream®; MetroGel-Vaginal®; MetroGel®; MetroLotion®; Noritate®; Vandazole™

Canadian Brand NamesApo-Metronidazole®; Flagyl®; Florazole® ER; MetroCream®; Metrogel®; Nidagel™; Noritate®; Trikacide

Pharmacologic CategoryAmebicide; Antibiotic, Miscellaneous; Antibiotic, Topical; Antiprotozoal, Nitroimidazole

Use: Labeled IndicationsTreatment of susceptible anaerobic bacterial and protozoal infections in the following conditions: Amebiasis, symptomatic and asymptomatic trichomoniasis; skin and skin structure infections; CNS infections; intra-abdominal infections (as part of combination regimen); systemic anaerobic infections; treatment of antibiotic-associated pseudomembranous colitis (AAPC), bacterial vaginosis; as part of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence

Topical: Treatment of inflammatory lesions and erythema of rosacea

Use: Unlabeled/InvestigationalCrohn's disease

Use: DentalTreatment of oral soft tissue infections due to anaerobic bacteria including all anaerobic cocci, anaerobic gram-negative bacilli (*Bacteroides*), and gram-positive spore-forming bacilli (*Clostridium*). Useful as single agent or in combination with amoxicillin, Augmentin®, or ciprofloxacin in the treatment of periodontitis associated with the presence of *Actinobacillus actinomycetemcomitans* (AA).

Dosing: Adults

Anaerobic infections (diverticulitis, intra-abdominal, peritonitis, cholangitis, or abscess): Oral, I.V.: 500 mg every 6-8 hours, not to exceed 4 g/day

Acne rosacea: Topical:

0.75%: Apply and rub a thin film twice daily, morning and evening, to entire affected areas after washing. Significant therapeutic results should be noticed within 3 weeks. Clinical studies have demonstrated continuing improvement through 9 weeks of therapy.

1%: Apply thin film to affected area once daily

Amebiasis: Oral: 500-750 mg every 8 hours for 5-10 days

Antibiotic-associated pseudomembranous colitis: Oral: 250-500 mg 3-4 times/day for 10-14 days; **Note:** Due to the emergence of a new strain of C. difficile, some clinicians recommend converting to oral vancomycin therapy if the patient does not show a clear clinical response after 2 days of metronidazole therapy.

Giardiasis: 500 mg twice daily for 5-7 days

Peptic ulcer disease:*Helicobacter pylori*eradication: Oral: 250-500 mg with meals and at bedtime for 14 days; requires combination therapy with at least one other antibiotic and an acid-suppressing agent (proton pump inhibitor or H_2 blocker)

Bacterial vaginosis or vaginitis due to *Gardnerella,Mobiluncus*:

Oral: 500 mg twice daily (regular release) or 750 mg once daily (extended release tablet) for 7 days

Vaginal: 1 applicatorful (~37.5 mg metronidazole) intravaginally once or twice daily for 5 days; apply once in morning and evening if using twice daily, if daily, use at bedtime

Trichomoniasis: Oral: 250 mg every 8 hours for 7 days **or** 375 mg twice daily for 7 days **or** 2 g as a single dose

Dosing: ElderlyUse the lower end of the dosing recommendations for adults; do not administer as single dose as efficacy has not been established.

Dosing: Pediatric

Anaerobic infections:

Infants and Children:

Oral: 15-35 mg/kg/day in divided doses every 8 hours

I.V.: 30 mg/kg/day in divided doses every 6 hours

Colitis due to*Clostridium difficile*: Oral: 20 mg/kg/day divided every 6 hours. Maximum dose: 2 g/day

Amebiasis: Infants and Children: Oral: 35-50 mg/kg/day in divided doses every 8 hours for 10 days

Trichomoniasis: Infants and Children: Oral: 15-30 mg/kg/day in divided doses every 8 hours for 7 days

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute, but not on dialysis: Recommendations vary: To reduce possible accumulation in patients receiving multiple doses, consider reduction to 50% of dose or every 12 hours; **Note:** Dosage reduction is unnecessary in short courses of therapy. Clinical recommendations and practice vary. Some references do not recommend reduction at any level of renal impairment (Lamp, 1999).

Hemodialysis effects: Extensively removed by hemodialysis and peritoneal dialysis (50% to 100%); dosage reduction not recommended; administer full dose posthemodialysis. During peritoneal dialysis, dose as for Cl_{cr} <10 mL/minute.

Continuous arteriovenous or venovenous hemofiltration: Dose as for normal renal function

Dosing: Hepatic ImpairmentUnchanged in mild liver disease; reduce dosage in severe liver disease.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V. DetailpH: 5-7 (ready to use); 0.5-2.0 (reconstituted); 6-7 (further dilution)

Administration: OralMay be taken with food to minimize stomach upset. Extended release tablets should be taken on an empty stomach (1 hour before or 2 hours after meals).

Administration: TopicalNo disulfiram-like reactions have been reported after **topical** application, although metronidazole can be detected in the blood. Apply to clean, dry skin. Cosmetics may be used after application (wait at least 5 minutes after using lotion).

Dietary ConsiderationsTake on an empty stomach. Drug may cause GI upset; if GI upset occurs, take with food. Extended release tablets should be taken on an empty stomach (1 hour before or 2 hours after meals). Sodium content of 500 mg (I.V.): 322 mg (14 mEq). The manufacturer recommends that ethanol be avoided during treatment and for 3 days after therapy is complete.

StorageMetronidazole injection should be stored at 15°C to 30°C and protected from light. Product may be refrigerated but crystals may form. Crystals redissolve on warming to room temperature. Prolonged exposure to light will cause a darkening of the product. However, short-term exposure to normal room light does not adversely affect metronidazole stability. Direct sunlight should be avoided. Stability of parenteral admixture at room temperature (25°C): Out of overwrap stability: 30 days.

ReconstitutionStandard diluent: 500 mg/100 mL NS.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Acyclovir, allopurinol, amiodarone, amifostine, cefepime, cisatracurium, clarithromycin, cyclophosphamide, diltiazem, docetaxel, dopamine, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, fluconazole, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, hydromorphone, labetalol, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, methylprednisolone sodium succinate, midazolam, morphine, perphenazine, piperacillin/tazobactam, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, aztreonam, filgrastim, meropenem, warfarin.

Compatibility when admixed: Compatible: Amikacin, aminophylline, ampicillin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, clindamycin, disopyramide, floxacillin, fluconazole, gentamicin, heparin, hydrocortisone sodium succinate, multivitamins, netilmicin, penicillin G potassium, tobramycin. **Incompatible:** Aztreonam, dopamine, meropenem. **Variable (consult detailed reference):** Cefamandole, cefepime.

Extemporaneously PreparedA 20 mg/mL oral suspension can be prepared by crushing ten 250 mg tablets in a mortar, and then adding 10 mL purified water USP to create a uniform paste. Add a small quantity of syrup, then transfer to a graduate and add a sufficient quantity of syrup to make 125 mL. Label “shake well” and “refrigerate.” Refrigerated stability is 10 days.

Irwin DB, Dupuis LL, Prober CG, et al, “The Acceptability, Stability, and Relative Bioavailability of an Extemporaneous Metronidazole Suspension,” *Can J Hosp Pharm*, 1987, 40:42-6.

Nahata MC, Morosco RS, and Hipple TF, 4th ed, *Pediatric Drug Formulations*, Cincinnati, OH: Harvey Whitney Books Co, 2000.

ContraindicationsHypersensitivity to metronidazole, nitroimidazole derivatives, or any component of the formulation; pregnancy (1st trimester - found to be carcinogenic in rats)

Allergy Considerations

- Nitroimidazole Allergy

Warnings/Precautions

Boxed warnings:

- Carcinogenic: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Carcinogenic: **[U.S. Boxed Warning]: Possibly carcinogenic based on animal data.**

- CNS effects: Seizures and neuropathies have been reported especially with increased doses and chronic treatment; if this occurs, discontinue therapy. Use with caution in patients with a history of seizure disorder; reduce doses with patients with CNS disease.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Blood dyscrasias: Use with caution in patients with blood dyscrasias.
- Heart failure: Use with caution in patients with heart failure or other sodium retaining states.
- Hepatic impairment: Use with caution in patients with liver impairment due to potential accumulation; reduce dosage in patients with severe impairment.
- *H. pylori* infection: If *H. pylori* is not eradicated in patients being treated with metronidazole in a regimen, it should be assumed that metronidazole-resistance has occurred and it should not again be used.
- Renal impairment: Consider dosage reduction in longer-term therapy with severe renal failure (Cl_{cr} <10 mL/minute).

Geriatric ConsiderationsAdjust dose based on renal function.

Pregnancy Risk FactorB (may be contraindicated in 1st trimester)

Pregnancy ConsiderationsCrosses the placenta (carcinogenic in rats); contraindicated for the treatment of trichomoniasis during the first trimester of pregnancy, unless alternative treatment is inadequate. Until safety and efficacy for other indications have been established, use only during pregnancy when the benefit to the mother outweighs the potential risk to the fetus.

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding ConsiderationsIt is suggested to stop breast-feeding for 12-24 hours following single dose therapy to allow excretion of dose.

Adverse Reactions

Systemic: Frequency not defined:

Cardiovascular: Flattening of the T-wave, flushing

Central nervous system: Ataxia, confusion, coordination impaired, dizziness, fever, headache, insomnia, irritability, seizure, vertigo

Dermatologic: Erythematous rash, urticaria

Endocrine & metabolic: Disulfiram-like reaction, dysmenorrhea, libido decreased

Gastrointestinal: Nausea (~12%), anorexia, abdominal cramping, constipation, diarrhea, furry tongue, glossitis, proctitis, stomatitis, unusual/metallic taste, vomiting, xerostomia

Genitourinary: Cystitis, darkened urine (rare), dysuria, incontinence, polyuria, vaginitis

Hematologic: Neutropenia (reversible), thrombocytopenia (reversible, rare)

Neuromuscular & skeletal: Peripheral neuropathy, weakness

Respiratory: Nasal congestion, rhinitis, sinusitis, pharyngitis

Miscellaneous: Flu-like syndrome, moniliasis

Topical: Frequency not defined:

Central nervous system: Headache

Dermatologic: Burning, contact dermatitis, dryness, erythema, irritation, pruritus, rash

Gastrointestinal: Unusual/metallic taste, nausea, constipation

Local: Local allergic reaction

Neuromuscular & skeletal: Tingling/numbness of extremities

Ocular: Eye irritation

Vaginal:

>10%: Genitourinary: Vaginal discharge (12%)

1% to 10%:

Central nervous system: Headache (5%), dizziness (2%)

Gastrointestinal: Gastrointestinal discomfort (7%), nausea and/or vomiting (4%), unusual/metallic taste (2%), diarrhea (1%)

Genitourinary: Vaginitis (10%), vulva/vaginal irritation (9%), pelvic discomfort (3%)

Hematologic: WBC increased (2%)

<1%: Abdominal bloating, abdominal gas, darkened urine, depression, fatigue, itching, rash, thirst, xerostomia

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak), 3A4 (moderate)

Drug Interactions

Alcohol (Ethyl): MetroNIDAZOLE may enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

Amprenavir: MetroNIDAZOLE may enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. *Risk X: Avoid combination*

Busulfan: MetroNIDAZOLE may increase the serum concentration of Busulfan. *Risk D: Consider therapy modification*

Calcineurin Inhibitors: MetroNIDAZOLE may decrease the metabolism of Calcineurin Inhibitors. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of MetroNIDAZOLE. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mebendazole: May enhance the adverse/toxic effect of MetroNIDAZOLE. Particularly the risk for Stevens-Johnson Syndrome or Toxic Epidermal Necrolysis may be increased. *Risk D: Consider therapy modification*

Mycophenolate: MetroNIDAZOLE may decrease the serum concentration of Mycophenolate. Specifically, metronidazole may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Tipranavir: MetroNIDAZOLE may enhance the adverse/toxic effect of Tipranavir. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): MetroNIDAZOLE may decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: The manufacturer recommends to avoid all ethanol or any ethanol-containing drugs (may cause disulfiram-like reaction characterized by flushing, headache, nausea, vomiting, sweating, or tachycardia).

Food: Peak antibiotic serum concentration lowered and delayed, but total drug absorbed not affected.

Test InteractionsMay interfere with AST, ALT, triglycerides, glucose, and LDH testing

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions according to dose, route of administration, and purpose of therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed. May take with or without food. Take with food if medication causes upset stomach. Extended release tablets should be taken on an empty stomach. Avoid alcohol during and for 72 hours after last dose. With alcohol you may experience severe flushing, headache, nausea, vomiting, or chest and abdominal pain. May discolor urine (brown/black/dark) (normal). You may experience "metallic" taste disturbance or nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Refrain from intercourse or use a contraceptive if being treated for trichomoniasis. Report unresolved or severe fatigue; weakness; fever or chills; mouth or vaginal sores; numbness, tingling, or swelling of extremities; respiratory difficulty; or lack of improvement or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Topical: Wash hands and area before applying. Apply medication thinly. Wash hands after applying. Avoid contact with eyes. Do not cover with occlusive dressing. Report severe skin irritation or if condition does not improve.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 375 mg

Flagyl®: 375 mg

Cream, topical: 0.75% (45 g)

MetroCream®: 0.75% (45 g) [contains benzyl alcohol]

Noritate®: 1% (60 g)

Gel, topical: 0.75% (45 g)

MetroGel®: 1% (46 g, 60 g) [60 g tube also packaged in a kit with Cetaphil® skin cleanser]

Gel, vaginal: 0.75% (70 g)

MetroGel-Vaginal®, Vandazole™: 0.75% (70 g)

Infusion [premixed iso-osmotic sodium chloride solution]: 500 mg (100 mL)

Lotion, topical: 0.75% (60 mL)

MetroLotion®: 0.75% (60 mL) [contains benzyl alcohol]

Tablet: 250 mg, 500 mg

Flagyl®: 250 mg, 500 mg

Tablet, extended release:

Flagyl® ER: 750 mg

500 mg (30): $160.64

Tablets (Metronidazole)

500 mg (30): $12.99

⇧ Mechanism of ActionAfter diffusing into the organism, interacts with DNA to cause a loss of helical DNA structure and strand breakage resulting in inhibition of protein synthesis and cell death in susceptible organisms

Pharmacodynamics/Kinetics

Absorption: Oral: Well absorbed; Topical: Concentrations achieved systemically after application of 1 g topically are 10 times less than those obtained after a 250 mg oral dose

Distribution: To saliva, bile, seminal fluid, breast milk, bone, liver, and liver abscesses, lung and vaginal secretions; crosses placenta and blood-brain barrier

CSF:blood level ratio: Normal meninges: 16% to 43%; Inflamed meninges: 100%

Protein binding: <20%

Metabolism: Hepatic (30% to 60%)

Half-life elimination: Neonates: 25-75 hours; Others: 6-8 hours, prolonged with hepatic impairment; End-stage renal disease: 21 hours

Time to peak, serum: Oral: Immediate release: 1-2 hours

Excretion: Urine (20% to 40% as unchanged drug); feces (6% to 15%)

Related Information

- Antimicrobial Drugs of Choice
- Community-Acquired Pneumonia in Adults
- Treatment of Sexually-Transmitted Infections

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Unusual/metallic taste, glossitis, stomatitis, xerostomia (normal salivary flow resumes upon discontinuation), and furry tongue.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; case reports of depression, insomnia, confusion, panic, delusions, hallucinations, exacerbation of schizophrenia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsMetronidazole may have effects similar to that of disulfiram (Antabuse®). If ethanol is taken during and within 24 hours of the last dose of metronidazole, patients may have severe flushing, headache, nausea, vomiting, or chest and abdominal pain.

Index TermsMetronidazole Hydrochloride

Metyrapone

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Metyrapone may be confused with metyrosine

Pronunciation(me TEER a pone)
U.S. Brand NamesMetopirone®
Pharmacologic CategoryDiagnostic Agent
Use: Labeled IndicationsDiagnostic test for hypothalamic-pituitary ACTH function
Dosing: Adults**Diagnostic test:** Oral: 750 mg every 4 hours for 6 doses
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Diagnostic test:** Oral: Children: 15 mg/kg every 4 hours for 6 doses; minimum dose: 250 mg
StorageDo not store above 30°C (86°F). Protect from moisture.
ContraindicationsHypersensitivity to metyrapone or any component of the formulation; patient with adrenal cortical insufficiency
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Reduced adrenal secretory capacity: Acute adrenal insufficiency may be induced in patients with reduced adrenal secretory capacity.

- Thyroid disease: Response to test may be subnormal in patients with hypo- or hyperthyroidism.

Pregnancy Risk FactorC
Pregnancy ConsiderationsUse during pregnancy only if clearly needed. Subnormal response may occur in pregnant women and the fetal pituitary may be affected.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Central nervous system: Headache, dizziness, sedation

Dermatologic: Allergic rash

Gastrointestinal: Nausea, vomiting, abdominal discomfort or pain

Hematologic: Rarely, decreased white blood cell count or bone marrow suppression

Metabolism/Transport Effects**Inhibits** CYP2A6 (weak); **Induces** CYP3A4 (weak)
Drug Interactions

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Phenytoin: May increase the metabolism of Metyrapone. The oral metyrapone test would thus be unreliable unless the metapyrone dosage was substantially increased (eg, 750 mg every 2 hours). *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg

Generic AvailableNo
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or sedation
Mental Health: Effects on Psychiatric TreatmentNone reported
International Brand NamesMetopiron (CH, NL, NO, SE); Metopirone (AU, CZ, FR, GB, IE)

Metyrosine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Metyrosine may be confused with metyrapone

Pronunciation(me TYE roe seen)
U.S. Brand NamesDemser®
Canadian Brand NamesDemser®
Pharmacologic CategoryTyrosine Hydroxylase Inhibitor
Use: Labeled IndicationsShort-term management of pheochromocytoma before surgery, long-term management when surgery is contraindicated or when chronic malignant pheochromocytoma exists
Dosing: Adults**Pheochromocytoma (preoperative):** Oral: Initial: 250 mg 4 times/day, increased by 250-500 mg/day up to 4 g/day; maintenance: 2-3 g/day in 4 divided doses; for preoperative preparation, administer optimum effective dosage for 5-7 days
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >12 years: Refer to adult dosing.
Dosing: Renal ImpairmentAdjustment should be considered.
ContraindicationsHypersensitivity to metyrosine or any component of the formulation; hypertension of unknown etiology
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: Maintain fluid volume during and after surgery.

Pregnancy Risk FactorC
Adverse Reactions

>10%:

Central nervous system: Drowsiness, extrapyramidal symptoms

Gastrointestinal: Diarrhea

1% to 10%:

Endocrine & metabolic: Galactorrhea, edema of the breasts

Gastrointestinal: Nausea, vomiting, xerostomia

Genitourinary: Impotence

Respiratory: Nasal congestion

<1%: Lower extremity edema, depression, hallucinations, disorientation, parkinsonism, urticaria, urinary problems, anemia, eosinophilia, hematuria, hyperstimulation after withdrawal

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg

Generic AvailableNo

Mechanism of ActionBlocks the rate-limiting step in the biosynthetic pathway of catecholamines. It is a tyrosine hydroxylase inhibitor, blocking the conversion of tyrosine to dihydroxyphenylalanine. This inhibition results in decreased levels of endogenous catecholamines. Catecholamine biosynthesis is reduced by 35% to 80% in patients treated with metyrosine 1-4 g/day.

Pharmacodynamics/Kinetics

Half-life elimination: 7.2 hours

Excretion: Primarily urine (as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and extrapyramidal symptoms are common; may cause depression, hallucinations, or confusion

Mental Health: Effects on Psychiatric TreatmentConcurrent use with antipsychotics may increase the risk of extrapyramidal symptoms

Index TermsAMPT; OGMT

International Brand NamesDemser (CA)

Mexiletine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(meks IL e teen)

U.S. Brand NamesMexitil® [DSC]

Canadian Brand NamesNovo-Mexiletine

Pharmacologic CategoryAntiarrhythmic Agent, Class Ib

Use: Labeled IndicationsManagement of serious ventricular arrhythmias; suppression of PVCs

Use: Unlabeled/InvestigationalDiabetic neuropathy

Dosing: Adults**Arrhythmias:** Oral: Initial: 200 mg every 8 hours (may load with 400 mg if necessary); adjust dose every 2-3 days; usual dose: 200-300 mg every 8 hours; maximum: 1.2 g/day (some patients respond to every 12-hour dosing). When switching from another antiarrhythmic, initiate a 200 mg dose 6-12 hours after stopping former agents, 3-6 hours after stopping procainamide.

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentPatients with hepatic impairment or CHF may require dose reduction; reduce dose to 25% to 30% of usual dose

Administration: I.V. DetailpH: 3-4 (adjusted with hydrochloric acid)

Administration: OralAdminister with food. Administer around-the-clock to promote less variation in peak and trough serum levels.

ContraindicationsHypersensitivity to mexiletine or any component of the formulation; cardiogenic shock; second- or third-degree AV block (except in patients with a functioning artificial pacemaker)

Warnings/Precautions

Boxed warnings:

- CAST trial: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Hepatotoxicity: Rare hepatic toxicity may occur; may cause acute hepatic injury.
- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.

Disease-related concerns:

- Conduction disturbances: Use with caution in patients with intraventricular conduction delays, first-degree heart block and/or pre-existing sinus node dysfunction.
- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- Heart failure (HF): Use with caution in patients with severe HF; may precipitate or exacerbate condition.
- Hepatic impairment: Use with caution in patients with significant hepatic impairment.
- Hypotension: Use with caution in patients with hypotension.

Other warnings/precautions:

- CAST trial: **[U.S. Boxed Warning]: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide.** An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.
- Urinary pH: Alterations in urinary pH may change urinary excretion.

Geriatric ConsiderationsNo specific changes in dose are necessary.

Pregnancy Risk FactorC

LactationEnters breast milk/compatible

Adverse Reactions

>10%:

Central nervous system: Lightheadedness (11% to 25%), dizziness (20% to 25%), nervousness (5% to 10%), incoordination (10%)

Gastrointestinal: GI distress (41%), nausea/vomiting (40%)

Neuromuscular & skeletal: Trembling, unsteady gait, tremor (13%), ataxia (10% to 20%)

1% to 10%:

Cardiovascular: Chest pain (3% to 8%), premature ventricular contractions (1% to 2%), palpitation (4% to 8%), angina (2%), proarrhythmia (10% to 15% in patients with malignant arrhythmia)

Central nervous system: Confusion, headache, insomnia (5% to 7%), depression (2%)

Dermatologic: Rash (4%)

Gastrointestinal: Constipation or diarrhea (4% to 5%), xerostomia (3%), abdominal pain (1%)

Neuromuscular & skeletal: Weakness (5%), numbness of fingers or toes (2% to 4%), paresthesia (2%), arthralgia (1%)

Ocular: Blurred vision (5% to 7%), nystagmus (6%)

Otic: Tinnitus (2% to 3%)

Respiratory: Dyspnea (3%)

<1% (Limited to important or life-threatening): Agranulocytosis, alopecia, AV block, cardiogenic shock, CHF (patients with pre-existing ventricular dysfunction), conduction disturbances, diaphoresis, diplopia, drug-induced lupus-like syndrome, dysphagia, edema, esophageal ulceration, exfoliative dermatitis, hallucinations, hepatic necrosis, hepatitis, hot flashes, hyper-/hypotension, impotence, leukopenia, LFTs increased, libido decreased, malaise, myelofibrosis (patients with pre-existing myeloid abnormalities), pancreatitis (rare), peptic ulcer, pharyngitis, positive antinuclear antibody, psychological changes, psychosis, salivary changes, seizure, short-term memory loss, sinus arrest, SLE syndrome, Stevens-Johnson syndrome, syncope, thrombocytopenia, torsade de pointes, transaminases increased, upper GI bleeding, urinary hesitancy, urinary retention

Postmarketing and/or case reports: Pulmonary fibrosis, urticaria

Metabolism/Transport Effects**Substrate** (major) of CYP1A2, 2D6; **Inhibits** CYP1A2 (strong)

Drug Interactions

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Mexiletine. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Mexiletine. **Exceptions:** Sertraline. *Risk D: Consider therapy modification*

Theophylline Derivatives: Mexiletine may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food may decrease the rate, but not the extent of oral absorption; diets which affect urine pH can increase or decrease excretion of mexiletine. Avoid dietary changes that alter urine pH.

Test InteractionsAbnormal liver function test, positive ANA, thrombocytopenia

Reference RangeTherapeutic range: 0.5-2 mcg/mL; potentially toxic: >2 mcg/mL

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor cardiac status. Assess for CNS changes. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy, when titrating dosage, and on a regular basis with long-term therapy. **Note:** Mexiletine has a low toxic:therapeutic ratio and overdose may easily produce severe and life-threatening reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsRegular serum levels

Patient EducationTake exactly as directed with food or antacids, around-the-clock. Do not take additional doses or discontinue without consulting prescriber. Do not change diet without consulting prescriber. You will need regular cardiac checkups and blood tests while taking this medication. You may experience drowsiness or dizziness, numbness, or visual changes (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or headaches or sleep disturbances (usually temporary, if persistent consult prescriber). Report chest pain, palpitation, or erratic heartbeat; increased weight or swelling of hands or feet; chills, fever, or persistent sore throat; numbness, weakness, trembling, or unsteady gait; blurred vision or ringing in ears; or respiratory difficulty. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, as hydrochloride: 150 mg, 200 mg, 250 mg

Mexitil®: 150 mg, 200 mg, 250 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Mexiletine HCl)

150 mg (90): $34.98

200 mg (90): $48.20

250 mg (90): $55.99

Mechanism of ActionClass IB antiarrhythmic, structurally related to lidocaine, which inhibits inward sodium current, decreases rate of rise of phase 0, increases effective refractory period/action potential duration ratio

Pharmacodynamics/Kinetics

Absorption: Elderly have a slightly slower rate, but extent of absorption is the same as young adults

Distribution: V_d: 5-7 L/kg

Protein binding: 50% to 70%

Metabolism: Hepatic; low first-pass effect

Half-life elimination: Adults: 10-14 hours (average: elderly: 14.4 hours, younger adults: 12 hours); prolonged with hepatic impairment or heart failure

Time to peak: 2-3 hours

Excretion: Urine (10% to 15% as unchanged drug); urinary acidification increases excretion, alkalinization decreases excretion

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and nervousness are common; may cause confusion and insomnia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; barbiturates may decrease the effects of mexiletine; monitor

Cardiovascular ConsiderationsMexiletine has a very narrow therapeutic index and significant toxicity may occur slightly above the therapeutic range. This is particularly problematic when other antiarrhythmic drugs are also being administered. Symptoms of mexiletine excess include sedation, confusion, seizures, respiratory arrest, and cardiac toxicity (sinus arrest, AV block, asystole, hypotension). Note that the QRS and QT intervals are usually normal, although they may be prolonged after massive overdose. As with other antiarrhythmic agents, mexiletine is also proarrhythmic, particularly in patients with underlying cardiovascular disease and electrolyte abnormalities.

Anesthesia and Critical Care Concerns/Other ConsiderationsAs with other antiarrhythmic agents, mexiletine is also proarrhythmic, particularly in patients with underlying cardiovascular disease and electrolyte abnormalities.

Jump To Field (Select Field Name)

Pronunciation(mi ka FUN gin)

U.S. Brand NamesMycamine®

Canadian Brand NamesMycamine®

Pharmacologic CategoryAntifungal Agent, Parenteral; Echinocandin

Use: Labeled IndicationsTreatment of esophageal candidiasis; *Candida* prophylaxis in patients undergoing hematopoietic stem cell transplant (HSCT); treatment of candidemia, acute disseminated candidiasis, and other *Candida* infections (peritonitis and abscesses)

Use: Unlabeled/InvestigationalTreatment of infections due to *Aspergillus* spp; prophylaxis of HIV-related esophageal candidiasis

Dosing: Adults

Candidemia, acute disseminated candidiasis, and*Candida*peritonitis and abscesses: I.V.: 100 mg daily; mean duration of therapy (from clinical trials) was 15 days (range: 10-47 days)

Esophageal candidiasis: I.V.: 150 mg daily; mean duration of therapy (from clinical trials) was 15 days (range: 10-30 days)

Prophylaxis of*Candida*infection in hematopoietic stem cell transplantation: 50 mg daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic ImpairmentNo dosage adjustment required for moderate hepatic impairment (Child-Pugh score 7-9). Patients with severe hepatic dysfunction have not been studied.

Administration: I.V.For intravenous use only; infuse over 1 hour

Administration: I.V. DetailFlush line with NS prior to administration.

pH: 5-7

StorageStore at controlled room temperature of 25°C (77°F). Reconstituted and diluted solutions are stable for 24 hours at room temperature. Protect from light.

ReconstitutionAseptically add 5 mL of NS (preservative-free) to each 50 or 100 mg vial. Swirl to dissolve; do not shake. Further dilute 50-150 mg in 100 mL NS. Protect from light. Alternatively, D_5W may be used for reconstitution and dilution.

CompatibilityDo not mix or coinfuse with other intravenous solutions.

ContraindicationsHypersensitivity to micafungin, other echinocandins, or any component of the formulation

Allergy Considerations

- Echinocandin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Anaphylactic reactions, including shock, have been reported.
- Hemolytic anemia/hemoglobinuria: Hemolytic anemia and hemoglobinuria have been reported.
- Hepatic failure: New onset or worsening hepatic failure has been reported; use caution in pre-existing mild-moderate hepatic impairment; safety in severe liver failure has not been evaluated.
- Renal impairment: Increased BUN, serum creatinine, renal dysfunction, and/or acute renal failure has been reported; use with caution in patients with pre-existing renal impairment and monitor closely.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsVisceral teratogenic and abortifacient effects were noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsPercentages reflect incidence across all approved indications (prophylaxis and treatment); however, in general, a higher frequency of adverse reactions was observed in studies with HSCT patients.

>10%:

Central nervous system: Fever (20%), headache (16%)

Endocrine & metabolic: Hypokalemia (18%), hypomagnesemia (13%)

Gastrointestinal: Diarrhea (23%), nausea (22%), vomiting (22%), mucosal inflammation (14%), constipation (11%)

Hematologic: Thrombocytopenia (15%), neutropenia (14%)

1% to 10%:

Cardiovascular: Hypotension (9%), tachycardia (8%), hypertension (7%), peripheral edema (7%), phlebitis (6%), edema (5%)

Central nervous system: Insomnia (10%), anxiety (6%), fatigue (6%)

Dermatologic: Rash (9%), pruritus (6%)

Endocrine & metabolic: Hypocalcemia (7%), hyperglycemia (6%)

Gastrointestinal: Abdominal pain (10%), anorexia (6%), dyspepsia (6%)

Hematologic: Anemia (10%), febrile neutropenia (6%)

Hepatic: AST increased (6%), ALT increased (5%), serum alkaline phosphatase increased (5%)

Neuromuscular & skeletal: Rigors (9%), back pain (5%)

Respiratory: Cough (8%), dyspnea (6%), epistaxis (6%)

Miscellaneous: Bacteremia (6%), sepsis (5%)

<1%, postmarketing and/or case reports, or frequency not defined: Acidosis, acute renal failure, anuria, apnea, arrhythmia, arthralgia, atrial fibrillation, BUN increased, cardiac arrest, coagulopathy, creatinine increased, cyanosis, deep vein thrombosis, delirium, hypoxia, encephalopathy, erythema multiforme, facial edema, hemoglobinuria, hemolysis, hemolytic anemia, hepatic dysfunction, hepatic failure, hepatocellular damage, hepatomegaly, hiccups, hyperbilirubinemia, hyponatremia, hypoxia, infection, injection site necrosis, injection site thrombosis, intracranial hemorrhage, jaundice, MI, mucosal inflammation, oliguria, pancytopenia, pneumonia, pulmonary embolism, renal impairment, renal tubular necrosis, seizure, shock, skin necrosis, thrombotic thrombocytopenia purpura, thrombophlebitis, urticaria, vasodilatation, WBC decreased

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP3A4 (weak)

Drug Interactions

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Monitoring ParametersLiver function tests

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium [preservative-free]:

Mycamine®: 50 mg, 100 mg [contains lactose]

Generic AvailableNo

Mechanism of ActionConcentration-dependent inhibition of 1,3-beta-D-glucan synthase resulting in reduced formation of 1,3-beta-D-glucan, an essential polysaccharide comprising 30% to 60% of *Candida* cell walls (absent in mammalian cells); decreased glucan content leads to osmotic instability and cellular lysis

Pharmacodynamics/Kinetics

Distribution: 0.28-0.5 L/kg

Protein binding: >99%; primarily to albumin

Metabolism: Hepatic; forms M-1 (catechol) and M-2 (methoxy) metabolites (activity unknown)

Half-life elimination: 11-21 hours

Excretion: Primarily feces (71%); urine (<15%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause delirium, dizziness, or sedation

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsMicafungin Sodium

English

Jump To Field (Select Field Name)

Pronunciation(mi KON a zole & zink OKS ide)

U.S. Brand NamesVusion®

Pharmacologic CategoryAntifungal Agent, Topical

Use: Labeled IndicationsAdjunctive treatment of diaper dermatitis complicated by *Candida albicans* infection

Dosing: Adults**Diaper dermatitis:** Topical: Refer to pediatric dosing.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Diaper dermatitis:** Topical: Children ≥4 weeks: Apply to affected area with each diaper change for 7 days. Treatment should continue for 7 days, even with initial improvement. Do not use for >7 days.

Administration: TopicalApply thin film to clean, dry skin. Do not rub into skin. Avoid use of scented soaps, shampoos, or lotions in the diaper area. Frequent diaper changes are recommended.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to miconazole, zinc oxide, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occurs, or if condition worsens.

Special populations:

- Immunocompromised patients: Has not been studied in immunocompromised patients.
- Incontinent adults: Safety and efficacy have not been established in incontinent adults.
- Pediatrics: Safety and efficacy have not been established in children <4 weeks of age or very low-birth-weight infants.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes or vagina. For use with a candidal infection documented by microscopic evaluation; not for prophylactic use.
- Duration of therapy: Safety and efficacy have not been established for use >7 days.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.

LactationExcretion in breast milk unknown/use caution

Drug Interactions

Alfentanil: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amphotericin B: Antifungal Agents (Azole Derivatives, Systemic) may diminish the therapeutic effect of Amphotericin B. *Risk C: Monitor therapy*

Aprepitant: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Quazepam. *Risk D: Consider therapy modification*

Bosentan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

BusPIRone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Busulfan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

Calcium Channel Blockers: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Cinacalcet: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cinacalcet. *Risk C: Monitor therapy*

Cisapride: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Conivaptan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Corticosteroids (Orally Inhaled): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inhibitors (Strong) may decrease the metabolism of CYP2A6 Substrates. *Risk D: Consider therapy modification*

CYP2B6 Substrates: CYP2B6 Inhibitors (Strong) may decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP2E1 Substrates: CYP2E1 Inhibitors (Moderate) may decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Docetaxel: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Dofetilide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Eletriptan: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Erlotinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Eszopiclone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fosaprepitant: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Gefitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Irinotecan: Antifungal Agents (Azole Derivatives, Systemic) may enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Losartan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Phosphodiesterase 5 Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

QuiNIDine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

Ramelteon: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

Solifenacin: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Sunitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Temsirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy modification*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Tolterodine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

VinCRIStine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Miconazole may increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ziprasidone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringFor topical use only when diaper dermatitis is complicated by documented candidiasis (microscopic evaluation). Teach caregiver proper application and adverse symptoms to report (see Patient Education).
Patient EducationVusion® is for topical use only. This ointment should not be used as a substitute for frequent diaper changes or to prevent diaper rash; nor should it be used on anyone for whom it is not prescribed. Use exactly as directed; complete full course of treatment, do not use longer than prescribed.

Application: Cleanse diaper area gently with lukewarm water or a very mild soap and pat dry with soft towel before applying Vusion®. Gently apply ointment to the diaper area with the fingertips after each diaper change. Do not rub ointment into the skin (may cause additional irritation). Wash hands after applying ointment. Use for full 7 days (or as directed), even if there is improvement. If symptoms have not improved after 7 days, notify prescriber. If skin condition in diaper area worsens, contact prescriber.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Ointment, topical:

Vusion®: Miconazole nitrate 0.25% and zinc oxide 15% (30 g [DSC]; 60 g)

Generic AvailableNo
ManufacturerBarrier Therapeutics, Inc
Pricing: U.S. (www.drugstore.com)

Ointment (Vusion)

0.25-15-81.35% (50): $251.16

0.25-15-81.35% (90): $267.11

Mechanism of Action

Miconazole inhibits the biosynthesis of ergosterol, damaging the fungal cell wall membrane.

Zinc oxide is a mild astringent with weak antiseptic properties.

Pharmacodynamics/KineticsAbsorption: Topical: Miconazole: Undetectable to 3.8 ng/mL in infants with dermatitis
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsZinc Oxide and Miconazole Nitrate
International Brand NamesBebektin (MX)

Micatin® may be confused with Miacalcin®

Pronunciation(mi KON a zole)

U.S. Brand NamesAloe Vesta® 2-n-1 Antifungal [OTC]; Baza® Antifungal [OTC]; Carrington Antifungal [OTC]; Critic-Aid® Clear AF [OTC]; DermaFungal [OTC]; Dermagran® AF [OTC]; DiabetAid™ Antifungal Foot Bath [OTC]; Fungoid® Tincture [OTC]; Lotrimin® AF Jock Itch Powder Spray [OTC]; Lotrimin® AF Powder/Spray [OTC]; Micaderm® [OTC]; Micatin® Athlete's Foot [OTC]; Micatin® Jock Itch [OTC]; Micro-Guard® [OTC]; Mitrazol™ [OTC]; Monistat-Derm® [DSC]; Monistat® 1 Combination Pack [OTC]; Monistat® 3 Combination Pack [OTC]; Monistat® 3 [OTC]; Monistat® 7 [OTC]; Neosporin® AF [OTC]; Podactin Cream [OTC]; Secura® Antifungal [OTC]; Zeasorb®-AF [OTC]

Canadian Brand NamesDermazole; Micatin®; Micozole; Monistat®; Monistat® 3

Pharmacologic CategoryAntifungal Agent, Topical; Antifungal Agent, Vaginal

Use: Labeled IndicationsTreatment of vulvovaginal candidiasis and a variety of skin and mucous membrane fungal infections

Dosing: Adults

Tinea corporis: Topical: Apply twice daily for 4 weeks

Tinea pedis: Topical: Apply twice daily for 4 weeks

Effervescent tablet: Dissolve 1 tablet in ~1 gallon of water; soak feet for 15-30 minutes; pat dry

Tinea cruris: Topical: Apply twice daily for 2 weeks

Vulvovaginal candidiasis: Vaginal:

Cream, 2%: Insert 1 applicatorful at bedtime for 7 days

Cream, 4%: Insert 1 applicatorful at bedtime for 3 days

Suppository, 100 mg: Insert 1 suppository at bedtime for 7 days

Suppository, 200 mg: Insert 1 suppository at bedtime for 3 days

Suppository, 1200 mg: Insert 1 suppository (a one-time dose); may be used at bedtime or during the day

Note: Many products are available as a combination pack, with a suppository for vaginal instillation and cream to relieve external symptoms. External cream may be used twice daily, as needed, for up to 7 days.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Tinea corporis, tinea pedis, tinea cruris: Topical: **Note:** Not for OTC use in children <2 years: Refer to adult dosing.

Vulvovaginal candidiasis: Vaginal: Children ≥12 years: Refer to adult dosing.

ContraindicationsHypersensitivity to miconazole or any component of the formulation

Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occurs.

Special populations:

- Pediatrics: Topical products are not for self-medication (OTC use) in children <2 years of age; vaginal products are not for OTC use in children <12 years of age.

Dosage form specific issues:

- Fungoid® tincture: Patients with diabetes, circulatory problems, renal or hepatic dysfunction should contact healthcare provider prior to self-medication (OTC use).

- Petrolatum-based: Vaginal products are petrolatum-based and may damage rubber or latex condoms or diaphragms; separate use by 3 days.

- Vaginal products: Consult with healthcare provider prior to self-medication (OTC use) if experiencing vaginal itching/discomfort, lower abdominal pain, back or shoulder pain, chills, nausea, vomiting, foul-smelling discharge, if this is the first vaginal yeast infection, or if exposed to HIV. Contact healthcare provider if symptoms do not begin to improve after 3 days or last longer than 7 days. May damage condoms or diaphragms.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes.

Geriatric ConsiderationsNo specific data for the elderly; use does not require alteration in dose or dose intervals. Assess patient's ability to self administer, may be difficult in patients with arthritis or limited range of motion.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Topical: Allergic contact dermatitis, burning, maceration

Vaginal: Abdominal cramps, burning, irritation, itching

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (moderate), 2A6 (strong), 2B6 (weak), 2C9 (strong), 2C19 (strong), 2D6 (strong), 2E1 (moderate), 3A4 (strong)
Drug Interactions

Alfentanil: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amphotericin B: Antifungal Agents (Azole Derivatives, Systemic) may diminish the therapeutic effect of Amphotericin B. *Risk C: Monitor therapy*

Aprepitant: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Quazepam. *Risk D: Consider therapy modification*

Bosentan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

BusPIRone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Busulfan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

Calcium Channel Blockers: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Cinacalcet: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cinacalcet. *Risk C: Monitor therapy*

Cisapride: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Conivaptan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Corticosteroids (Orally Inhaled): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inhibitors (Strong) may decrease the metabolism of CYP2A6 Substrates. *Risk D: Consider therapy modification*

CYP2B6 Substrates: CYP2B6 Inhibitors (Strong) may decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP2E1 Substrates: CYP2E1 Inhibitors (Moderate) may decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Docetaxel: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Dofetilide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Eletriptan: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Erlotinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Eszopiclone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fosaprepitant: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Gefitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Irinotecan: Antifungal Agents (Azole Derivatives, Systemic) may enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Losartan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Phosphodiesterase 5 Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

QuiNIDine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

Ramelteon: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

Solifenacin: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Sunitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Temsirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy modification*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Tolterodine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

VinCRIStine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Miconazole may increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ziprasidone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease miconazole levels.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Caution patients with diabetes to test serum glucose regularly; may inhibit the metabolism of oral sulfonylureas. Teach patient proper use, possible side effects/appropriate interventions (eg, bleeding precautions), and adverse symptoms to report.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy. Use full course of therapy as directed; do not discontinue without consulting prescriber. Some infections may require long periods of therapy. Practice good hygiene measures to prevent reinfection. If you have diabetes, you should test serum glucose regularly - this medication may inhibit the metabolism of oral sulfonylureas. Report persistent burning, itching, or irritation to healthcare provider. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Topical: Wash and dry area before applying medication; apply thinly. Do not get in or near eyes. Not for OTC use in children <2 years of age.

Vaginal: Consult with healthcare provider if using for a vaginal yeast infection for the first time. Insert high in vagina. Refrain from intercourse during treatment. Condoms and diaphragms may not be effective during therapy. Do not use tampons, douches, spermicides, or other vaginal products during treatment. Deodorant-free pads or panty shields may be used to protect clothing during use.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Combination products: Miconazole nitrate vaginal suppository 200 mg (3s) and miconazole nitrate external cream 2%

Monistat® 1 Combination Pack: Miconazole nitrate vaginal insert 1200 mg (1) and miconazole nitrate external cream 2% (5 g) [Note: Do not confuse with 1-Day™ (formerly Monistat® 1) which contains tioconazole]

Monistat® 3 Combination Pack:

Miconazole nitrate vaginal insert 200 mg (3s) and miconazole nitrate external cream 2%

Miconazole nitrate vaginal cream 4% and miconazole nitrate external cream 2%

Monistat® 7 Combination Pack:

Miconazole nitrate vaginal suppository 100 mg (7s) and miconazole nitrate external cream 2%

Miconazole nitrate vaginal cream 2% (7 prefilled applicators) and miconazole nitrate external cream 2%

Cream, topical, as nitrate: 2% (15 g, 30 g, 45 g)

Baza® Antifungal: 2% (4 g, 57 g, 142 g) [zinc oxide based formula]

Carrington Antifungal: 2% (150 g)

Micaderm®, Neosporin® AF, Podactin: 2% (30 g)

Micatin® Athlete's Foot, Micatin® Jock Itch: 2% (15 g)

Micro-Guard®, Mitrazol™: 2% (60 g)

Monistat-Derm®: 2% (15 g, 30 g, 85 g) [DSC]

Secura® Antifungal: 2% (60 g, 98 g)

Cream, vaginal, as nitrate [prefilled or refillable applicator]: 2% (45 g)

Monistat® 3: 4% (15 g, 25 g)

Monistat® 7: 2% (45 g)

Gel, topical, as nitrate:

Zeasorb®-AF: 2% (24 g)

Liquid, spray, topical, as nitrate:

Micatin® Athlete's Foot: 2% (90 mL) [contains alcohol]

Neosporin AF®: 2% (105 mL)

Lotion, powder, as nitrate:

Zeasorb®-AF: 2% (56 g) [contains alcohol 36%] [DSC]

Ointment, topical, as nitrate:

Aloe Vesta® 2-n-1 Antifungal: 2% (60 g, 150 g)

Critic-Aid® Clear AF: 2% (4 g, 57 g, 142 g)

DermaFungal: 2% (113 g)

Dermagran® AF: (113 g) [contains vitamin A and zinc]

Powder, topical, as nitrate:

Lotrimin® AF: 2% (160 g)

Micro-Guard®: 2% (90 g)

Mitrazol™: 2% (30 g)

Zeasorb®-AF: 2% (70 g)

Powder spray, topical, as nitrate:

Lotrimin® AF, Lotrimin® AF Jock Itch: 2% (140 g)

Micatin® Athlete’s Foot, Micatin® Jock Itch: 2% (90 g) [contains alcohol]

Neosporin® AF: 2% (85 g)

Suppository, vaginal, as nitrate: 100 mg (7s); 200 mg (3s)

Monistat® 3: 200 mg (3s)

Monistat® 7: 100 mg (7s)

Tablet, for solution, topical, as nitrate [effervescent]:

DiabetAid™ Antifungal Foot Bath: 2% (10s)

Tincture, topical, as nitrate (Fungoid®): 2% (30 mL, 473 mL) [contains isopropyl alcohol 30%]; 30 mL size also available in a treatment kit which contains nail scrub and nail brush]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Cream (Miconazole Nitrate)

2% (28): $12.99

Cream (Monistat-Derm)

2% (15): $24.99

2% (28.35): $41.99

Powder (Zeasorb-AF)

2% (70): $14.99

Solution (Fungoid Tincture)

2% (29.57): $29.99

Suppository (Miconazole 3)

200 mg (3): $34.99

Suppository (Monistat 3)

200 mg (3): $52.99

Mechanism of ActionInhibits biosynthesis of ergosterol, damaging the fungal cell wall membrane, which increases permeability causing leaking of nutrients

Pharmacodynamics/Kinetics

Absorption: Topical: Negligible

Distribution: Widely to body tissues; penetrates well into inflamed joints, vitreous humor of eye, and peritoneal cavity, but poorly into saliva and sputum; crosses blood-brain barrier but only to a small extent

Protein binding: 91% to 93%

Metabolism: Hepatic

Half-life elimination: Multiphasic: Initial: 40 minutes; Secondary: 126 minutes; Terminal: 24 hours

Excretion: Feces (~50%); urine (<1% as unchanged drug)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Versed may be confused with VePesid®, Vistaril®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(MID aye zoe lam)

Canadian Brand NamesApo-Midazolam®; Midazolam Injection

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsPreoperative sedation and provides conscious sedation prior to diagnostic or radiographic procedures; ICU sedation (continuous infusion); intravenous anesthesia (induction); intravenous anesthesia (maintenance)

Use: Unlabeled/InvestigationalAnxiety, status epilepticus

Use: DentalSedation component in I.V. conscious sedation in oral surgery patients; syrup formulation is used for children to help alleviate anxiety before a dental procedure

Dosing: Adults

Note: The dose of midazolam needs to be individualized based on the patient's age, underlying diseases, and concurrent medications. Decrease dose (by ~30%) if narcotics or other CNS depressants are administered concomitantly. **Personnel and equipment needed for standard respiratory resuscitation should be immediately available during midazolam administration.**

Preoperative sedation:

I.M.: 0.07-0.08 mg/kg 30-60 minutes prior to surgery/procedure; usual dose: 5 mg; **Note:** Reduce dose in patients with COPD, high-risk patients, patients ≥60 years of age, and patients receiving other narcotics or CNS depressants

I.V.: 0.02-0.04 mg/kg; repeat every 5 minutes as needed to desired effect or up to 0.1-0.2 mg/kg

Intranasal (not an approved route): 0.2 mg/kg (up to 0.4 mg/kg in some studies); administer 30-45 minutes prior to surgery/procedure

Conscious sedation: I.V.: Initial: 0.5-2 mg slow I.V. over at least 2 minutes; slowly titrate to effect by repeating doses every 2-3 minutes if needed; usual total dose: 2.5-5 mg; use decreased doses in elderly.

Healthy Adults <60 years:

Initial: Some patients respond to doses as low as 1 mg; no more than 2.5 mg should be administered over a period of 2 minutes. Additional doses of midazolam may be administered after a 2-minute waiting period and evaluation of sedation after each dose increment. A total dose >5 mg is generally not needed. If narcotics or other CNS depressants are administered concomitantly, the midazolam dose should be reduced by 30%. *Refer to elderly dosing for patients ≥60 years, debilitated, or chronically ill.*

Maintenance: 25% of dose used to reach sedative effect

Anesthesia: I.V.:

Induction:

Unpremedicated patients: 0.3-0.35 mg/kg (up to 0.6 mg/kg in resistant cases)

Premedicated patients: 0.15-0.35 mg/kg

Maintenance: 0.05-0.3 mg/kg as needed, or continuous infusion 0.25-1.5 mcg/kg/minute

Sedation in mechanically-ventilated patients: I.V. continuous infusion: 100 mg in 250 mL D_5W or NS (if patient is fluid-restricted, may concentrate up to a maximum of 0.5 mg/mL); initial dose: 0.02-0.08 mg/kg (~1 mg to 5 mg in 70 kg adult) initially and either repeated at 5-15 minute intervals until adequate sedation is achieved or continuous infusion rates of 0.04-0.2 mg/kg/hour and titrate to reach desired level of sedation

Refractory status epilepticus (unlabeled use): I.V.: Initial: 0.2 mg/kg bolus, then 0.05-0.6 mg/kg/hour

Dosing: ElderlyThe dose of midazolam needs to be individualized based on the patient's age, underlying diseases, and concurrent medications. Decrease dose (by ~30%) if narcotics or other CNS depressants are administered concomitantly. **Personnel and equipment needed for standard respiratory resuscitation should be immediately available during midazolam administration.**

I.V.: Conscious sedation: Initial: 0.5 mg slow I.V.; give no more than 1.5 mg in a 2-minute period. If additional titration is needed, give no more than 1 mg over 2 minutes, waiting another 2 or more minutes to evaluate sedative effect. A total dose >3.5 mg is rarely necessary.

Dosing: Pediatric

Notes: The dose of midazolam needs to be individualized based on the patient's age, underlying diseases, and concurrent medications. Decrease dose (by ~30%) if narcotics or other CNS depressants are administered concomitantly. **Personnel and equipment needed for standard respiratory resuscitation should be immediately available during midazolam administration.** Children <6 years may require higher doses and closer monitoring than older children; calculate dose on ideal body weight

Conscious sedation for procedures or preoperative sedation:

Oral: 0.25-0.5 mg/kg as a single dose preprocedure, up to a maximum of 20 mg; administer 30-40 minutes prior to procedure. Children <6 years, or less cooperative patients may require as much as 1 mg/kg as a single dose; 0.25 mg/kg may suffice for children 6-16 years of age.

Intranasal (not an approved route): 0.2 mg/kg (up to 0.4 mg/kg in some studies), administered 30-45 minutes prior to procedure

I.M.: 0.1-0.15 mg/kg 30-60 minutes before surgery or procedure; range 0.05-0.15 mg/kg; doses up to 0.5 mg/kg have been used in more anxious patients; maximum total dose: 10 mg

I.V.:

Infants <6 months: Limited information is available in nonintubated infants; dosing recommendations not clear; infants <6 months are at higher risk for airway obstruction and hypoventilation; titrate dose in small increments to desired effect; monitor carefully

Infants 6 months to Children 5 years: Initial: 0.05-0.1 mg/kg; titrate dose carefully; total dose of 0.6 mg/kg may be required; usual maximum total dose: 6 mg

Children 6-12 years: Initial: 0.025-0.05 mg/kg; titrate dose carefully; total doses of 0.4 mg/kg may be required; usual maximum total dose: 10 mg

Children 12-16 years: Dose as adults; usual maximum total dose: 10 mg

Conscious sedation during mechanical ventilation: I.V.: Children: Loading dose: 0.05-0.2 mg/kg, followed by initial continuous infusion: 1-2 mcg/kg/minute; titrate to the desired effect; usual range: 0.4-6 mcg/kg/minute

Status epilepticus refractory to standard therapy (unlabeled use): I.V.: Infants >2 months and Children: Loading dose: 0.15 mg/kg followed by a continuous infusion of 0.06 mg/kg/hour; titrate dose upward every 5 minutes until clinical seizure activity is controlled; mean infusion rate required in 24 children was 0.14 mg/kg/hour (2.3 mcg/kg/minute) with a range of 0.06-1.1 mg/kg/hour

Dosing: Renal Impairment

Hemodialysis: Supplemental dose is not necessary.

Peritoneal dialysis: Significant drug removal is unlikely based on physiochemical characteristics.

Administration: I.M.Give deep I.M. into large muscle.

Administration: I.V.Administer by slow I.V. injection over at least 2-5 minutes at a concentration of 1-5 mg/mL or by I.V. infusion. Continuous infusions should be administered via an infusion pump.

Administration: I.V. DetailpH: 3 (adjusted)

Administration: OralDo not mix with any liquid (such as grapefruit juice) prior to administration.

Administration: OtherIntranasal: Administer using a 1 mL needleless syringe into the nares over 15 seconds; use the 5 mg/mL injection; $^1/_2$ of the dose may be administered to each nare

Dietary ConsiderationsInjection: Sodium content of 1 mL: 0.14 mEq

StorageThe manufacturer states that midazolam, at a final concentration of 0.5 mg/mL, is stable for up to 24 hours when diluted with D_5W or NS. A final concentration of 1 mg/mL in NS has been documented to be stable for up to 10 days (McMullen, 1995). Admixtures do not require protection from light for short-term storage.

CompatibilityStable in D_5NS, D_5W, NS; **incompatible** with LR.

Y-site administration: Compatible: Alatrofloxacin, amikacin, amiodarone, atracurium, calcium gluconate, cefazolin, cefotaxime, cimetidine, ciprofloxacin, cisatracurium, clindamycin, digoxin, diltiazem, dopamine, epinephrine, erythromycin lactobionate, esmolol, etomidate, famotidine, fentanyl, fluconazole, gatifloxacin, gentamicin, haloperidol, heparin, hydromorphone, insulin (regular), ketanserin, labetalol, linezolid, lorazepam, methylprednisolone sodium succinate, metronidazole, milrinone, morphine, nicardipine, nitroglycerin, norepinephrine, pancuronium, piperacillin, potassium chloride, ranitidine, remifentanil, sodium nitroprusside, sufentanil, theophylline, tobramycin, vancomycin, vecuronium. **Incompatible:** Albumin, amphotericin B cholesteryl sulfate complex, ampicillin, bumetanide, butorphanol, ceftazidime, cefuroxime, clonidine, dexamethasone sodium succinate, floxacillin, foscarnet, fosphenytoin, furosemide, hydrocortisone sodium succinate, imipenem/cilastatin, methotrexate, nafcillin, omeprazole, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole. **Variable (consult detailed reference):** Dobutamine, propofol.

Compatibility in syringe: Compatible: Alfentanil, atracurium, atropine, buprenorphine, butorphanol, chlorpromazine, cimetidine, diamorphine, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, morphine, nalbuphine, ondansetron, promazine, promethazine, scopolamine, sufentanil, thiethylperazine, trimethobenzamide. **Incompatible:** Dimenhydrinate, pentobarbital, perphenazine, prochlorperazine edisylate, ranitidine.

Compatibility when admixed: Compatible: Hydromorphone.

RestrictionsC-IV

ContraindicationsHypersensitivity to midazolam or any component of the formulation, including benzyl alcohol (cross-sensitivity with other benzodiazepines may exist); parenteral form is not for intrathecal or epidural injection; narrow-angle glaucoma; concurrent use of potent inhibitors of CYP3A4 (amprenavir, atazanavir, or ritonavir); pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Boxed warnings:

- Benzyl alcohol: See “Dosage form specific issues” below.
- Debilitated patients: See “Special populations” below.
- Elderly: See “Special populations” below.
- Respiratory depression: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). A minimum of 1 day should elapse after midazolam administration before attempting these tasks.
- Hypotension: May cause hypotension; hemodynamic events are more common in pediatric patients or patients with hemodynamic instability. Hypotension may occur more frequently in patients who have received opioid analgesics.
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.
- Respiratory depression: **[U.S. Boxed Warning]: May cause severe respiratory depression, respiratory arrest, or apnea. Use with extreme caution, particularly in noncritical care settings.** Appropriate resuscitative equipment and qualified personnel must be available for administration and monitoring. Initial dosing must be cautiously titrated and individualized, particularly in elderly or debilitated patients, patients with hepatic impairment (including alcoholics), or in renal impairment, particularly if other CNS depressants (including opiates) are used concurrently.

Disease-related concerns:

- Heart failure (HF): Use with caution in patients with HF.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: **[U.S. Boxed Warning]: Initial doses in debilitated patients should be conservative; start at the lower end of dosing range.**
- Elderly: **[U.S. Boxed Warning]: Initial doses in elderly should be conservative; start at the lower end of dosing range.**
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.
- Obese patients: Use with caution in obese patients; may have prolonged action when discontinued.

Dosage form specific issues:

- Benzyl alcohol: **[U.S. Boxed Warning]: Parenteral form contains benzyl alcohol; avoid rapid injection in neonates or prolonged infusions.**

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties. Does not protect against increases in heart rate or blood pressure during intubation. Should not be used in shock, coma, or acute alcohol intoxication. Avoid intra-arterial administration or extravasation of parenteral formulation. Use during upper airway procedures may increase risk of hypoventilation. Prolonged responses have been noted following extended administration by continuous infusion (possibly due to metabolite accumulation) or in the presence of drugs which inhibit midazolam metabolism.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsIn the elderly if concomitant CNS depressant medications are used, the midazolam dose will be at least 50% less than doses used in healthy, young, unpremedicated patients.

Pregnancy Risk FactorD

Pregnancy Considerations Midazolam has been found to cross the placenta; not recommended for use during pregnancy.
Lactation Enters breast milk/not recommended (AAP rates "of concern")
Adverse Reactions As reported in adults unless otherwise noted:

>10%: Respiratory: Decreased tidal volume and/or respiratory rate decrease, apnea (3% children)

1% to 10%:

Cardiovascular: Hypotension (3% children)

Central nervous system: Drowsiness (1%), oversedation, headache (1%), seizure-like activity (1% children)

Gastrointestinal: Nausea (3%), vomiting (3%)

Local: Pain and local reactions at injection site (4% I.M., 5% I.V.; severity less than diazepam)

Ocular: Nystagmus (1% children)

Respiratory: Cough (1%)

Miscellaneous: Physical and psychological dependence with prolonged use, hiccups (4%, 1% children), paradoxical reaction (2% children)

<1%: Acid taste, agitation, amnesia, bigeminy, bradycardia, bronchospasm, confusion, dyspnea, emergence delirium, euphoria, excessive salivation, hallucinations, hyperventilation, laryngospasm, PVC, rash, tachycardia, wheezing

Metabolism/Transport Effects **Substrate** of CYP2B6 (minor), 3A4 (major); **Inhibits** CYP2C8 (weak), 2C9 (weak), 3A4 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Atorvastatin: May increase the serum concentration of Midazolam. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Efavirenz: May increase the serum concentration of Midazolam. *Risk X: Avoid combination*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may increase serum concentrations of midazolam; avoid concurrent use with oral form.

Herb/Nutraceutical: Avoid concurrent use with St John's wort (may decrease midazolam levels, may increase CNS depression). Avoid concurrent use with valerian, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status, blood pressure, blood pressure monitor required during I.V. administration

Nursing: Physical Assessment/MonitoringAssess other medications the patient may be taking for effectiveness and interactions. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. **I.V.:** Monitor cardiac and respiratory status continuously. Monitor I.V. infusion site carefully for extravasation. **I.V./I.M.:** Monitor closely following administration. Bedrest and assistance with ambulation necessary for several hours. **Note:** Full recovery usually occurs within 2-3 hours, but may take 6 hours.

Patient EducationAvoid use of alcohol, prescription or OTC sedatives, or hypnotics for a minimum of 24 hours after administration. Avoid driving or engaging in any tasks that require alertness for 24 hours following administration. You may experience some loss of memory following administration. **Pregnancy/breast-feeding precautions:** Advise prescriber if you are pregnant; this medication is contraindicated for pregnant women. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 1 mg/mL (2 mL, 5 mL, 10 mL); 5 mg/mL (1 mL, 2 mL, 5 mL, 10 mL) [contains benzyl alcohol 1%]

Injection, solution [preservative free]: 1 mg/mL (2 mL, 5 mL); 5 mg/mL (1 mL, 2 mL)

Syrup: 2 mg/mL (118 mL) [contains sodium benzoate; cherry flavor]

Generic AvailableYes

ManufacturerRoche Laboratories Inc

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action: I.M.: Sedation: ~15 minutes; I.V.: 1-5 minutes

Peak effect: I.M.: 0.5-1 hour

Duration: I.M.: Up to 6 hours; Mean: 2 hours

Absorption: Oral: Rapid

Distribution: V_d: 0.8-2.5 L/kg; increased with congestive heart failure (CHF) and chronic renal failure

Protein binding: 95%

Metabolism: Extensively hepatic via CYP3A4

Bioavailability: Mean: 45%

Half-life elimination: 1-4 hours; prolonged with cirrhosis, congestive heart failure, obesity, and elderly

Excretion: Urine (as glucuronide conjugated metabolites); feces (~2% to 10%)

- Status Epilepticus
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms. For neonates, since both concentrations of the injection contain 1% benzyl alcohol, use the 5 mg/mL injection and dilute to 0.5 mg/mL with SWI without preservatives to decrease the amount of benzyl alcohol delivered to the neonate; with continuous infusion, midazolam may accumulate in peripheral tissues; use lowest effective infusion rate to reduce accumulation effects; midazolam is 3-4 times as potent as diazepam; paradoxical reactions associated with midazolam use in children (eg, agitation, restlessness, combativeness) have been successfully treated with flumazenil (Massanari, 1997).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Midazolam is a short half-life benzodiazepine and may be of benefit in patients where a rapidly and short-acting agent is desired (acute agitation). Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Midazolam is rapidly and completely absorbed after I.M. injection.

Cardiovascular ConsiderationsHypotension may result in orthostatic lightheadedness or syncope. Benzodiazepines, as a class, may depress respiration. These medications may often be prescribed for difficulty in sleeping but may exacerbate sleep-disordered breathing.

Anesthesia and Critical Care Concerns/Other Considerations

Agitation in the ICU Patient: Diazepam or midazolam is recommended for rapid sedation of the acutely-agitated patient. Midazolam may accumulate in obesity, in patients with hypoalbuminemia, or renal failure. Concurrent use of CYP3A4 inhibitors may inhibit midazolam's metabolism and prolong its sedative effects. The ACCM/SCCM task force does not recommend midazolam use for ongoing sedation in the practice guidelines for sustained use of sedatives and analgesics in the critically-ill adult. Midazolam is 3-4 times as potent as diazepam. Paradoxical reactions associated with midazolam use in children (eg, agitation, restlessness, combativeness) have been successfully treated with flumazenil.

Index TermsMidazolam Hydrochloride; Versed

Medication Safety Issues

Sound-alike/look-alike issues:

ProAmatine® may be confused with protamine

Pronunciation(MI doe dreen)

U.S. Brand NamesProAmatine®

Canadian Brand NamesAmatine®; Apo-Midodrine®

Pharmacologic CategoryAlpha$_1$ Agonist

Use: Labeled Indications**Orphan drug:** Treatment of symptomatic orthostatic hypotension

Use: Unlabeled/InvestigationalInvestigational: Management of urinary incontinence

Dosing: Adults**Orthostatic hypotension:** Oral: 10 mg 3 times/day during daytime hours (every 3-4 hours) when patient is upright (maximum: 40 mg/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment2.5 mg 3 times/day; gradually increase as tolerated.

Hemodialysis: Dialyzable

Administration: OralDoses may be given in approximately 3- to 4-hour intervals (eg, shortly before or upon rising in the morning, at midday, in the late afternoon not later than 6 PM). Avoid dosing after the evening meal or within 4 hours of bedtime. Continue therapy only in patients who appear to attain symptomatic improvement during initial treatment. Standing systolic blood pressure may be elevated 15-30 mm Hg at 1 hour after a 10 mg dose. Some effect may persist for 2-3 hours.

ContraindicationsHypersensitivity to midodrine or any component of the formulation; severe organic heart disease; urinary retention; pheochromocytoma; thyrotoxicosis; persistent and significant supine hypertension

Warnings/Precautions

Boxed warnings:

- Appropriate use: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Hypertension: May cause hypertension.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Urinary retention: Use with caution in patients with urinary retention; reduce initial dose.

- Visual problems: Use with caution in patients with visual problems, especially if receiving fludrocortisone.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Indicated for patients for whom orthostatic hypotension significantly impairs their daily life despite standard clinical care.** Use is not recommended with supine hypertension.

- Monitoring: Monitor renal and hepatic function prior to and periodically during therapy.

Geriatric ConsiderationsAdjust dosage for renal impairment.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIncreased rate of embryo resorption and decreased fetal weight were observed in animal studies. Use during pregnancy should be avoided unless the potential benefit outweighs the risk to the fetus.

LactationExcretion in breast milk is unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Supine hypertension (7% to 13%)

Dermatologic: Piloerection (13%), pruritus (12%)

Genitourinary: Urinary urgency, retention, or polyuria, dysuria (up to 13%)

Neuromuscular & skeletal: Paresthesia (18%)

1% to 10%:

Central nervous system: Chills (5%), pain (5%)

Dermatologic: Rash (2%)

Gastrointestinal: Abdominal pain

<1%: Anxiety, canker sore, confusion, dizziness, dry skin, erythema multiforme, facial flushing, flatulence, flushing, headache, hyperesthesia, insomnia, ICP increased, leg cramps, nausea, somnolence, visual changes, weakness, xerostomia

Drug Interactions

Beta-Blockers: May enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Cardiac Glycosides: May enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Monitoring ParametersBlood pressure, renal and hepatic parameters

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, risk for increased bradycardia with cardiac glycosides, psychotherapeutics, beta-blockers). Assess therapeutic effectiveness (reduction of hypotension) and adverse reactions (eg, supine hypertension, urinary urgency/retention, rash) at beginning of therapy and periodically thereafter. **Note:** Standing blood pressure may be elevated 1 hour after administration and remain slightly elevated 3-4 hours. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsKidney and liver function tests

Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially anything that may affect blood pressure; cough or cold medications, diet, weight reduction, stay-awake products). Take exactly as directed; take when sitting upright. Do not take within 4 hours of bedtime or when lying down for any length of time. Follow instructions for checking blood pressure and pulse routinely (same time of day; for 1 week at least). May cause urinary urgency or retention (void before taking or consult prescriber if difficulty persists); or dizziness, drowsiness, or headache (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report skin rash, severe gastric upset or pain, muscle weakness or pain, or other persistent side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 2.5 mg, 5 mg, 10 mg

ProAmatine®: 2.5 mg, 5 mg, 10 mg [scored]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Midodrine HCl)

2.5 mg (30): $34.99

5 mg (100): $200.00

10 mg (100): $290.16

Tablets (ProAmatine)

2.5 mg (100): $139.99

5 mg (100): $255.98

Mechanism of ActionMidodrine forms an active metabolite, desglymidodrine, that is an alpha$_1$-agonist. This agent increases arteriolar and venous tone resulting in a rise in standing, sitting, and supine systolic and diastolic blood pressure in patients with orthostatic hypotension. See table.

Causes of Orthostatic Hypotension

Primary Autonomic Causes

Pure autonomic failure (Bradbury-Eggleston syndrome, idiopathic orthostatic hypotension)
Autonomic failure with multiple system atrophy (Shy-Drager syndrome)
Familial dysautonomia (Riley-Day syndrome)
Dopamine beta-hydroxylase deficiency
Secondary Autonomic Causes
Chronic alcoholism
Parkinson's disease
Diabetes mellitus
Porphyria
Amyloidosis
Various carcinomas
Vitamin B_1 or B_{12} deficiency
Nonautonomic Causes
Hypovolemia (such as associated with hemorrhage, burns, or hemodialysis) and dehydration
Diminished homeostatic regulation (such as associated with aging, pregnancy, fever, or prolonged bedrest)
Medications (eg, antihypertensives, insulin, tricyclic antidepressants)

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Duration: 2-3 hours

Absorption: Rapid

Distribution: V_d (desglymidodrine): <1.6 L/kg; poorly across membrane (eg, blood brain barrier)

Protein binding: Minimal

Metabolism: Hepatic; midodrine is a prodrug which undergoes rapid deglycination to desglymidodrine (active metabolite); metabolism occurs in many tissues and plasma

Bioavailability: Desglymidodrine: 93%

Half-life elimination: Desglymidodrine: ~3-4 hours; Midodrine: 25 minutes

Time to peak, serum: Desglymidodrine: 1-2 hours; Midodrine: 30 minutes

Excretion: Urine (2% to 4%)

Clearance: Desglymidodrine: 385 mL/minute (predominantly by renal secretion)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, confusion, or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsMidodrine may increase blood pressure and should be carefully monitored in patients with underlying coronary artery disease. Midodrine should not be administered after 6 PM or within 4 hours of bedtime since the key therapeutic aim is to attenuate orthostatic hypotension. Midodrine may also worsen supine hypertension, a problem seen frequently in patients with diabetic autonomic neuropathy.

Index TermsMidodrine Hydrochloride

International Brand NamesGutron (AT, BG, CH, CL, CN, CZ, DE, FR, HK, HN, HU, IL, IT, NL, NZ, PL, PT, RU, SG, UY); Metligine (JP); Midon (IE); Midorine (TW); Midron (KP)

Mifepristone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Mifeprex® may be confused with Mirapex®

Mifepristone may be confused with misoprostol

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(mi FE pris tone)

U.S. Brand NamesMifeprex®

Pharmacologic CategoryAbortifacient; Antineoplastic Agent, Hormone Antagonist; Antiprogestin

Use: Labeled IndicationsMedical termination of intrauterine pregnancy, through day 49 of pregnancy. Patients may need treatment with misoprostol and possibly surgery to complete therapy

Use: Unlabeled/InvestigationalTreatment of unresectable meningioma; has been studied in the treatment of breast cancer, ovarian cancer, and adrenal cortical carcinoma

Dosing: Adults

Termination of pregnancy: Oral: Treatment consists of three office visits by the patient; the patient must read medication guide and sign patient agreement prior to treatment:

Day 1: 600 mg (three 200 mg tablets) taken as a single dose under physician supervision

Day 3: Patient must return to the healthcare provider 2 days following administration of mifepristone; unless abortion has occurred (confirmed using ultrasound or clinical examination): 400 mcg (two 200 mcg tablets) of misoprostol; patient may need treatment for cramps or gastrointestinal symptoms at this time

Day 14: Patient must return to the healthcare provider ~14 days after administration of mifepristone; confirm complete termination of pregnancy by ultrasound or clinical exam. Surgical termination is recommended to manage treatment failures.

Dosing for unlabeled uses: Refer to individual protocols. The dose used in meningioma is usually 200 mg/day, continued based on toxicity and response.

Dosing: ElderlySafety and efficacy have not been established.

Dosing: Renal ImpairmentSafety and efficacy have not been established.

Dosing: Hepatic ImpairmentSafety and efficacy have not been established; use with caution due to CYP3A4 metabolism.

StorageStore at room temperature of 25°C (77°F).

RestrictionsInvestigators wishing to obtain the agent for use in oncology patients must apply for a patient-specific IND from the FDA. Mifepristone will be supplied only to licensed physicians who sign and return a “Prescriber's Agreement.” Distribution of mifepristone will be subject to specific requirements imposed by the distributor. Mifepristone will **not** be available to the public through licensed pharmacies. An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Not available in Canada

ContraindicationsHypersensitivity to mifepristone, misoprostol, other prostaglandins, or any component of the formulation; chronic adrenal failure; porphyrias; hemorrhagic disorder or concurrent anticoagulant therapy; pregnancy termination >49 days; intrauterine device (IUD) in place; ectopic pregnancy or undiagnosed adnexal mass; concurrent long-term corticosteroid therapy; inadequate or lack of access to emergency medical services; inability to understand effects and/or comply with treatment

Warnings/Precautions

Boxed warnings:

- Bacterial infections: See “Concerns related to adverse effects” below.
- Bleeding: See “Concerns related to adverse effects” below.
- Medication guide: See “Other warnings/precautions” below.

- Patient instruction: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Bacterial infections: **[U.S. Boxed Warning]: Bacterial infections have been reported following use of this product.** In rare cases, these infections may be serious and/or fatal, with septic shock as a potential complication. A causal relationship has not been established. Sustained fever, abdominal pain, or pelvic tenderness should prompt evaluation; however, healthcare professionals are warned that atypical presentations of serious infection without these symptoms have also been noted. Patients presenting with nausea, vomiting, diarrhea, or weakness, with or without abdominal pain or fever, should be evaluated for serious bacterial infection when symptoms occur >24 hours after taking misoprostol. Treatment with antibiotics, including coverage for anaerobic bacteria (eg, *Clostridium sordellii*) should be initiated.

- Bleeding: **[U.S. Boxed Warning]: Patients should be counseled to seek medical attention in cases of excessive bleeding.** Bleeding occurs and should be expected (average 9-16 days, may be ≥30 days). In some cases, bleeding may be prolonged and heavy, potentially leading to hypovolemic shock; the manufacturer cites soaking through two thick sanitary pads per hour for two consecutive hours as an example of excessive bleeding. Bleeding may require blood transfusion (rare), curettage, saline infusions, and/or vasoconstrictors.

Disease-related concerns:

- Anemia: Safety and efficacy have not been established for use in women with severe anemia.

- Cardiovascular disease: Safety and efficacy have not been established for use in women with chronic cardiovascular disease as well as hypertension.

- Diabetes: Safety and efficacy have not been established for use in women with insulin-dependent diabetes mellitus.

- Hepatic impairment: Safety and efficacy have not been established for use in women with hepatic impairment.

- Renal impairment: Safety and efficacy have not been established for use in women with renal impairment.

- Respiratory disease: Safety and efficacy have not been established for use in women with respiratory disease.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Smokers: Use with caution in patients who are heavy smoker (>10 cigarettes/day); these patients were excluded from clinical trials.

- Women >35 years: Use with caution in women >35 years; these patients were excluded from clinical trials.

Other warnings/precautions:

- Confirmation of terminated pregnancy: 14 days following treatment confirmation of pregnancy termination by clinical exam or ultrasound must be made. Manufacturer recommends surgical termination of pregnancy when medical termination fails or is not complete. Prescriber should determine in advance whether they will provide such care themselves or through other providers. Preventative measures to prevent rhesus immunization must be taken prior to surgical abortion.

- Ectopic pregnancy: Ultrasound should be used if an ectopic pregnancy is suspected or if duration of pregnancy is uncertain. Ultrasonography may not identify all ectopic pregnancies, and healthcare providers should be alert for signs and symptoms which may be related to undiagnosed ectopic pregnancy in any patient who receives mifepristone.

- Experienced physician: To be administered only by physicians who can date pregnancy, diagnose ectopic pregnancies, provide access to surgical abortion (if needed), and can provide access to emergency care. Medication will be distributed directly to these physicians following signed agreement with the distributor. Must be administered under supervision by the qualified physician.

- Medication guide: **[U.S. Boxed Warning]: Patients undergoing treatment with mifepristone should be instructed to bring their Medication Guide with them when an obtaining treatment from an emergency room or healthcare provider that did not prescribe the medication initially in order to identify that they are undergoing a medical abortion.**

- Patient instruction: **[U.S. Boxed Warning]: Patient must be instructed of the treatment procedure and expected effects.** A signed agreement form must be kept in the patient's file. Physicians may obtain patient agreement forms, physician enrollment forms, and medical consultation directly from Danco Laboratories at 1-877-432-7596. Prescriber should also give the patient clear instructions on whom to call and what to do in the event of an emergency following administration of therapy.

- Pregnancy dating: Pregnancy is dated from day 1 of last menstrual period (presuming a 28-day cycle, ovulation occurring midcycle). Pregnancy duration can be determined using menstrual history and clinical examination. Ultrasound should be used if duration of pregnancy is uncertain.

- Reporting of adverse effects: Adverse effects (including blood transfusions, hospitalization, ongoing pregnancy, and other major complications) must be reported in writing to the medication distributor.

Pregnancy Risk FactorX

Pregnancy ConsiderationsThis medication is used to terminate pregnancy; there are no approved treatment indications for its use during pregnancy. Prostaglandins (including mifepristone and misoprostol) may have teratogenic effects when used during pregnancy. If treatment fails, there is a risk of fetal malformation. In sexually active women, pregnancy can occur prior to the first menstrual period following treatment. Appropriate contraception can be started as soon as termination of pregnancy is confirmed or before sexual intercourse is resumed.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsBreast milk should be discarded for a few days following use of this medication.

Adverse ReactionsVaginal bleeding and uterine cramping are expected to occur when this medication is used to terminate a pregnancy; 90% of women using this medication for this purpose also report adverse reactions. Bleeding or spotting occurs in most women for a period of 9-16 days. Up to 8% of women will experience some degree of bleeding or spotting for 30 days or more. In some cases, bleeding may be prolonged and heavy, potentially leading to hypovolemic shock.

>10%:

Central nervous system: Headache (2% to 31%), dizziness (1% to 12%)

Gastrointestinal: Abdominal pain (cramping) (96%), nausea (43% to 61%), vomiting (18% to 26%), diarrhea (12% to 20%)

Genitourinary: Uterine cramping (83%)

1% to 10%:

Cardiovascular: Syncope (1%)

Central nervous system: Fatigue (10%), fever (4%), insomnia (3%), anxiety (2%), fainting (2%)

Gastrointestinal: Dyspepsia (3%)

Genitourinary: Uterine hemorrhage (5%), vaginitis (3%), pelvic pain (2%), endometriosis/salpingitis/pelvic inflammatory disease (1%)

Hematologic: Decreased hemoglobin >2 g/dL (6%), anemia (2%), leukorrhea (2%)

Neuromuscular & skeletal: Back pain (9%), rigors (3%), leg pain (2%), weakness (2%)

Respiratory: Sinusitis (2%)

Miscellaneous: Viral infection (4%)

<1%: Significant ALT/AST, alkaline phosphatase, and GT changes have been reported rarely

Postmarketing and/or case reports: Adult respiratory distress syndrome (ADRS), allergic reaction including urticaria and hives, bacterial infection (including an ectopic bacteria such as *Clostridium sordellii*), Crohn's disease (exacerbation), disseminated intravascular coagulopathy (DIC), dyspnea, hypotension, lightheadedness, loss of consciousness, MI, pancreatitis (acute), postabortal infection, QT prolongation, ruptured ectopic pregnancy, sepsis, septic shock, sickle cell crisis (exacerbation), tachycardia, toxic shock syndrome

In trials for unresectable meningioma, the most common adverse effects included fatigue, hot flashes, gynecomastia or breast tenderness, hair thinning, and rash. In premenopausal women, vaginal bleeding may be seen shortly after beginning therapy and cessation of menses is common. Thyroiditis and effects related to antiglucocorticoid activity have also been noted.

Oncology: VesicantNo
Oncology: Emetic PotentialMild
Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP2D6 (weak), 3A4 (weak)
Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Food: Do not take with grapefruit juice; grapefruit juice may inhibit mifepristone metabolism leading to increased levels.

Herb/Nutraceutical: Avoid St John's wort (may induce mifepristone metabolism, leading to decreased levels).

Test InteractionshCG levels will not be useful to confirm pregnancy termination until at least 10 days following mifepristone treatment
Monitoring ParametersClinical exam and/or ultrasound to confirm complete termination of pregnancy; hemoglobin, hematocrit, and red blood cell count in cases of heavy bleeding. Consider CBC in any patient who reports nausea, vomiting, or diarrhea and weakness with or without abdominal pain, and without fever or other signs of infection more than 24 hours after administration of misoprostol.
Nursing: Physical Assessment/MonitoringMay only be administered under supervision of a qualified physician. Patient must be instructed in procedure and sign patient agreement forms. Assess results of laboratory tests and adverse reactions. Monitor for excessive bleeding. Monitor vital signs. Assess knowledge/teach patient interventions to reduce side effects, and adverse reactions to report. **Pregnancy risk factor X:** This medication is used to terminate pregnancy.
Monitoring: Lab TestsConsider CBC in any patient who reports nausea, vomiting, or diarrhea and weakness with or without abdominal pain, and without fever or other signs of infection more than 24 hours after administration of misoprostol.
Patient EducationThis medication is used to terminate pregnancy under 7 weeks. It must be administered under direction of a qualified physician. You will need follow-up visits as directed by your prescriber (approximately 3 days and 14 days after treatment). Surgical termination of pregnancy may be required if medication fails; there is a risk of fetal malformation if treatment fails. You may experience vaginal bleeding and cramping that is heavier than a normal menstrual period; report immediately if severe or persistent. You may experience nausea, vomiting, and diarrhea. It is possible to get pregnant before your next period. Once the pregnancy has proved to be ended, contraception should be started before having sexual intercourse. Read carefully all information about this medication provided by your prescriber. **Pregnancy/breast-feeding precautions:** Your physician will give you a phone number to call for problems, questions, or emergencies; you should not use this medication if you do not have access to emergency care. You will be given a medication guide to help you understand this medication and its effects. It is important to review this carefully. Ask any questions you may have. You will also be required to sign a form saying that you understand the effects of this treatment and are able to return to the physician for follow-up appointments. Do not breast-feed. Discard breast milk for a few days following use of this medication.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 200 mg

Generic AvailableNo
ManufacturerDanco Laboratories
Mechanism of ActionMifepristone, a synthetic steroid, competitively binds to the intracellular progesterone receptor, blocking the effects of

progesterone. When used for the termination of pregnancy, this leads to contraction-inducing activity in the myometrium. In the absence of progesterone, mifepristone acts as a partial progesterone agonist. Mifepristone also has weak antiglucocorticoid and antiandrogenic properties; it blocks the feedback effect of cortisol on corticotropin secretion.

Pharmacodynamics/Kinetics

Absorption: Oral: rapid

Protein binding: 98% to albumin and α_1-acid glycoprotein

Metabolism: Hepatic via CYP3A4 to three metabolites (may possess some antiprogestin and antiglucocorticoid activity)

Bioavailability: Oral: 69%

Half-life elimination: Terminal: 18 hours following a slower phase where 50% eliminated between 12-72 hours

Time to peak: Oral: 90 minutes

Excretion: Feces (83%); urine (9%)

Pharmacotherapy PearlsMedication will be distributed directly to qualified physicians following signed agreement with the distributor, Danco Laboratories. It will not be available through pharmacies. Major adverse reactions (hospitalization, blood transfusion, ongoing pregnancy, etc) should be reported to Danco Laboratories.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, fatigue, insomnia, or anxiety

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; use caution with lithium, valproic acid, and SSRIs. Fluoxetine, fluvoxamine, and nefazodone may increase mifepristone serum levels and/or toxicity; monitor. Carbamazepine, phenobarbital, and St John's wort may increase the metabolism of mifepristone, resulting in decreased mifepristone levels and/or effect; monitor.

International Brand NamesMifegyne (BE, CH, DE, DK, EE, FI, FR, GB, IL, NL, NO, NZ, SE); Mifonewle (CL); Unwanted (IN)

Miglitol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(MIG li tol)

U.S. Brand NamesGlyset®

Canadian Brand NamesGlyset®

Pharmacologic CategoryAntidiabetic Agent, Alpha-Glucosidase Inhibitor

Use: Labeled IndicationsType 2 diabetes mellitus (noninsulin-dependent, NIDDM):

Monotherapy adjunct to diet to improve glycemic control in patients with type 2 diabetes mellitus (noninsulin-dependent, NIDDM) whose hyperglycemia cannot be managed with diet alone

Combination therapy with a sulfonylurea when diet plus either miglitol or a sulfonylurea alone do not result in adequate glycemic control. The effect of miglitol to enhance glycemic control is additive to that of sulfonylureas when used in combination.

Dosing: Adults**Type 2 diabetes (noninsulin dependent, NIDDM):** Oral: 25 mg 3 times/day with the first bite of food at each meal; the dose may be increased to 50 mg 3 times/day after 4-8 weeks; maximum recommended dose: 100 mg 3 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentMiglitol is primarily excreted by the kidneys; there is little information of miglitol in patients with a Cl_{cr} <25 mL/minute.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: OralShould be taken orally at the start (with the first bite) of each main meal.

ContraindicationsHypersensitivity to miglitol or any of component of the formulation; diabetic ketoacidosis; inflammatory bowel disease; colonic ulceration; partial intestinal obstruction or predisposition to intestinal obstruction; chronic intestinal diseases associated with marked disorders of digestion or absorption or with conditions that may deteriorate as a result of increased gas formation in the intestine

Warnings/Precautions

Concerns related to adverse effects:

- GI symptoms: Most common reactions are gastrointestinal related; incidence of abdominal pain and diarrhea tend to diminish considerably with continued treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment (serum creatinine >2 mg/dL); studies in this population have not been conducted and treatment is not recommended.

- Stress-related states: It may be necessary to discontinue miglitol and administer insulin if the patient is exposed to stress (ie, fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- Sulfonylureas: In combination with a sulfonylurea will cause a further lowering of blood glucose and may increase the hypoglycemic potential of the sulfonylurea.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsIn a double-blind randomized, placebo-controlled trial, glyburide caused significantly greater reductions in hemoglobin A_{1c} compared to miglitol 25 mg or 50 mg three times per day, but was associated with more weight gain. Diarrhea, soft stools, and flatulence were more common with miglitol. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been reported in animal reproduction studies; therefore, miglitol is classified as pregnancy category B. Information specific to the use of miglitol during pregnancy has not been located. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationEnters breast milk (small amounts)/not recommended

Breast-Feeding ConsiderationsMiglitol is found in breast milk. The exposure to a nursing infant is ~0.4% of a 100 mg maternal dose. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Miglitol in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Flatulence (42%), diarrhea (29%), abdominal pain (12%)

1% to 10%: Dermatologic: Rash

Drug Interactions

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Monitoring ParametersMonitor therapeutic response by periodic blood glucose tests; measurement of glycosylated hemoglobin is recommended for the monitoring of long-term glycemic control

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness, and adverse response on a regular basis throughout therapy. Teach patient proper use (or refer patient to diabetic educator), possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsBlood glucose tests; measurement of glycosylated hemoglobin is recommended for the monitoring of long-term glycemic control.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take exactly as directed, with the first bite of each main meal. Do not change dosage or discontinue without first consulting prescriber. Avoid alcohol. It is important to follow dietary and lifestyle recommendations of prescriber. You will be instructed in signs of hypo- or hyperglycemia by prescriber or diabetic educator. If combining this medication with other diabetic medication (eg, sulfonylureas, insulin), keep source of glucose in the form of dextrose (NOT table sugar, candy, or cookies) on hand in case hypoglycemia occurs. May cause mild side effects during first weeks of therapy (eg, bloating, flatulence, diarrhea, abdominal discomfort); these should diminish over time. Report severe or persistent side effects, fever, extended vomiting or flu, or change in color of urine or stool. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg, 100 mg

Generic AvailableNo

ManufacturerPharmacia & Upjohn

Pricing: U.S. (www.drugstore.com)

Tablets (Glyset)

25 mg (90): $87.99

50 mg (90): $96.80

100 mg (90): $109.99

Mechanism of ActionIn contrast to sulfonylureas, miglitol does not enhance insulin secretion; the antihyperglycemic action of miglitol results from a reversible inhibition of membrane-bound intestinal alpha-glucosidases which hydrolyze oligosaccharides and disaccharides to glucose and other monosaccharides in the brush border of the small intestine. In patients with diabetes, this enzyme inhibition results in delayed glucose absorption and lowering of postprandial hyperglycemia.

Pharmacodynamics/Kinetics

Absorption: Saturable at high doses: 25 mg dose: Completely absorbed; 100 mg dose: 50% to 70% absorbed

Distribution: V_d: 0.18 L/kg

Protein binding: <4%

Metabolism: None

Half-life elimination: ~2 hours

Time to peak: 2-3 hours

Excretion: Urine (as unchanged drug)

Related Information

- Diabetes Mellitus Management, Adults

Dental Health: Effects on Dental TreatmentAlthough miglitol does not cause hypoglycemia, it is frequently used in combination and may complicate the management of hypoglecemic episodes caused by other medications. As part of its therapeutic effect, miglitol slows the absorption of complex sugars or disaccharides such as sucrose. This would delay effective treatment of hypoglycemia. Simple sugars, including glucose (dextrose), are not affected. If a patient experiences hypoglycemia, use of food items such as table sugar, candy, or cookies will NOT effectively increase blood glucose. Administration of oral glucose is required in mild-moderate hypoglycemia, and parenteral glucose is required for severe hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects

Miglustat

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(MIG loo stat)
U.S. Brand NamesZavesca®
Canadian Brand NamesZavesca®
Pharmacologic CategoryEnzyme Inhibitor
Use: Labeled IndicationsTreatment of mild-to-moderate type 1 Gaucher disease when enzyme replacement therapy is not a therapeutic option
Dosing: Adults**Type 1 Gaucher disease:** Oral: 100 mg 3 times/day; dose may be reduced to 100 mg 1-2 times/day in patients with adverse effects (ie, tremor, GI distress)
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment

Cl_{cr} 50-75 mL/minute: 100 mg twice daily

Cl_{cr} 30-50 mL/minute: 100 mg once daily

Cl_{cr} <30 mL/minute: Not recommended

Calculations

- Creatinine Clearance: Adults

Administration: OralCapsules should be swallowed whole and taken at the same time each day. May be taken with or without food.
Dietary ConsiderationsMay be taken with or without food. Patients with diarrhea should avoid foods with high carbohydrate content.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to miglustat or any component of the formulation; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Diarrhea: Observed in the majority of patients, many also reported weight loss. Incidence decreases over time; foods with high carbohydrate content should be avoided. If symptoms persist, patients should be evaluated for underlying GI disease.

- Peripheral neuropathy: Has been reported; neurologic monitoring is required. Weigh risk versus benefit of therapy if patient develops numbness and tingling.

- Tremor: Exacerbations of existing tremor or tremor may occur; may resolve over time or respond to dosage reduction.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustments recommended. Not recommended in patients with severe impairment.

- Severe type 1 Gaucher disease: Safety and efficacy have not been established in severe type 1 Gaucher disease.

Concurrent drug therapy issues:

- Imiglucerase: Miglustat increases the clearance of imiglucerase; combination therapy is not indicated.

Pregnancy Risk FactorX
Pregnancy ConsiderationsDecreased fetus weight, fetal loss, and difficult or delayed births were observed in animal studies. Women with reproduction potential should use effective contraception during therapy. In addition, adverse effects on spermatogenesis and reduced fertility were observed in male animal studies. The manufacturer recommends that male patients use reliable contraception during therapy and for 3 months following treatment.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsPercentages reported from open-label, uncontrolled monotherapy trials.

>10%:

Central nervous system: Headache (21% to 22%), dizziness (up to 11%)

Gastrointestinal: Diarrhea (89% to 100%), weight loss (39% to 67%), abdominal pain (18% to 67%), flatulence (29% to 50%), nausea (8% to 22%), vomiting (4% to 11%)

Neuromuscular & skeletal: Tremor (11% to 30%), weakness (17%), leg cramps (4% to 11%)

Ocular: Visual disturbances (up to 17%)

1% to 10%:

Central nervous system: Memory impairment (8%), migraine (up to 6%)

Endocrine & metabolic: Menstrual disorder (up to 6%)

Gastrointestinal: Constipation (8%), xerostomia (8%), bloating (up to 8%), anorexia (up to 7%), dyspepsia (up to 7%), epigastric pain (up to 6%)

Hematologic: Thrombocytopenia (6% to 7%)

Neuromuscular & skeletal: Paresthesia (up to 7%)

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Food: Food decreases the rate, but not the extent, of absorption.

Monitoring ParametersNeurologic evaluations baseline and repeated every 6 months; adverse effects; weight
Nursing: Physical Assessment/MonitoringUse caution with renal impairment. Not to be used in combination with imiglucerase. Assess results of neurological evaluations at beginning of therapy and every 6 months during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (tremor, peripheral neuropathy). **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Do not give to women of childbearing age or males who may have intercourse with childbearing age females unless they are capable of complying with effective contraceptive measures during therapy. Men should continue contraceptive measures for 3 months following treatment.
Patient EducationCapsules should be swallowed whole and taken at the same time each day, with or without food. May cause headache and dizziness (use caution when driving or engaging in hazardous tasks until response to drug is known); nausea, vomiting, or loss of appetite (small, frequent meals and good mouth care may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Notify prescriber at once of persistent diarrhea, numbness or tingling in extremities, change in vision, or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug can cause fetal abnormalities. Both females and males should use (consult prescriber) appropriate contraception during therapy. Males should continue contraceptive use for 3 months following therapy. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Zavesca®: 100 mg

Generic AvailableNo
ManufacturerAlmac Pharma Services; marketed by Actelion Pharmaceuticals
Mechanism of ActionMiglustat competitively and reversibly inhibits the enzyme needed to produce glycosphingolipids and decreases the rate of glycosphingolipid glucosylceramide formation. Glucosylceramide accumulates in type 1 Gaucher disease, causing complications specific to this disease.
Pharmacodynamics/Kinetics

Distribution: V_d: 83-105 L

Protein binding: No binding to plasma proteins

Metabolism: No evidence of metabolism in humans

Bioavailability: 97%

Half-life elimination: 6-7 hours

Time to peak, plasma: 2-2.5 hours

Excretion: Urine (as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness is common
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; use caution with SSRIs

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Savella™ may be confused with cevimeline, sevelamer

Pronunciation(mil NAY ci pran)

U.S. Brand NamesSavella™

Pharmacologic CategoryAntidepressant, Serotonin/Norepinephrine Reuptake Inhibitor

Use: Labeled IndicationsManagement of fibromyalgia

Dosing: Adults**Fibromyalgia:** Oral: 50 mg twice daily (maximum dose: 200 mg/day). **Note:** Recommended titration schedule: 12.5 mg once on day one, then 12.5 mg twice daily on days 2-3, 25 mg twice daily on days 4-7, then 50 mg twice daily thereafter.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild renal impairment: No dose adjustment is recommended.

Moderate renal impairment: Use with caution.

Severe renal impairment (Cl_{cr} ≤29 mL/minute): Reduce maintenance dose to 25 mg twice daily; dose may be increased to 50 mg twice daily, based on individual tolerance.

End-stage renal disease (ESRD): Use not recommended.

Dosing: Hepatic Impairment

Mild-to-moderate hepatic impairment: No dose adjustment is recommended.

Severe hepatic impairment: Use with caution.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food; food may improve tolerability.

Dietary ConsiderationsMay be taken with or without food; food may improve tolerability.

StorageStore at 25°C (77°F); excursions permitted between 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide is available. Distribute to each patient to whom this medication is dispensed.

ContraindicationsConcomitant use or within 2 weeks of MAO inhibitors; uncontrolled narrow-angle glaucoma

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See "Major psychiatric warnings" below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor for clinical worsening, suicidality, or unusual changes in behavior; the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants in children and teenagers should be dispensed with each prescription. **Milnacipran is not FDA approved for the treatment of major depressive disorder or for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Milnacipran is not FDA approved for the treatment of bipolar disorder.**

Concerns related to adverse effects:

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin or NSAIDs due to ulcerogenic potential. Data are inconclusive regarding extent of bleeding risk of SNRIs in combination with warfarin or other anticoagulants. Bleeding related to SNRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- Cardiovascular effects: May increase blood pressure and heart rate; blood pressure and heart rate should be evaluated prior to initiating therapy and periodically thereafter; consider dose reduction or gradual discontinuation of therapy in individuals with sustained hypertension or tachycardia during therapy; use with caution in patients with pre-existing hypertension, tachyarrhythmias (eg, atrial fibrillation), or other cardiovascular disease.

- Hepatotoxicity: Avoid use in patients with substantial ethanol intake, evidence of chronic liver disease or hepatic impairment. Cases of increased liver enzymes and severe liver injury (including fulminant hepatitis) have been reported. Discontinue therapy with the presentation of jaundice or other signs of hepatic dysfunction and do not reinitiate therapy unless another source or cause is identified.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

- Urinary hesitancy: May cause increased urinary resistance; advise patient to report symptoms of urinary hesitation/difficulty.

Disease-related concerns:

- Narrow-angle glaucoma: Associated with an increased risk of mydriasis in patients with controlled narrow-angle glaucoma.

- Seizure disorders: Use caution with a previous seizure disorder or condition predisposing to seizures such as brain damage or alcoholism.

Concurrent drug therapy issues:

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur. Do not use milnacipran in combination with an MAO inhibitor or within 14 days of discontinuing an MAO inhibitor; do not start an MAO inhibitor until ≥5 days after discontinuing milnacipran.

- Serotonin modulators: Serotonin syndrome with symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, nausea/vomiting, diarrhea, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce milnacipran's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Elderly: Use caution in elderly patients; risk of hyponatremia may be increased.

- Pediatrics: Safety and efficacy have not been established in children <17 years of age.

Dosage form specific issues:

- Tartrazine: Contains tartrazine (FD&C Yellow No. 5); may cause allergic reactions (eg, bronchial asthma) in susceptible individuals.

Other warnings/precautions:

- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. To discontinue therapy with milnacipran, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefits justify the risks.

Nonteratogenic effects in the newborn following SSRI/SNRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hyper- or hypotonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. The long-term effects on neurobehavior have not been studied.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is unknown if milnacipran is excreted in human milk; there are no adequate and well-controlled studies in nursing mothers. Animal studies have shown milnacipran or its metabolites excreted in breast milk. Use during lactation only if the potential benefits to the mother outweigh the potential risks to the infant.

Adverse Reactions

>10%:

Central nervous system: Headache (18%), insomnia (12%)

Endocrine & metabolic: Hot flashes (12%)

Gastrointestinal: Nausea (37%), constipation (16%)

1% to 10%:

Cardiovascular: Palpitation (7%), heart rate increased (6%), hypertension (5%), flushing (3%), blood pressure increased (3%), tachycardia (2%), peripheral edema (≥1%)

Central nervous system: Dizziness (10%), migraine (5%), chills (2%), tremor (2%), depression (≥1%), fatigue (≥1%), fever (≥1%), irritability (≥1%), somnolence (≥1%)

Dermatologic: Hyperhidrosis (9%), rash (3%)

Endocrine & metabolic: Hypercholesterolemia (≥1%)

Gastrointestinal: Vomiting (7%), xerostomia (5%), abdominal pain (3%), appetite decreased (2%), abdominal distension (≥1%), abnormal taste (≥1%), diarrhea (≥1%), dyspepsia (≥1%), flatulence (≥1%), gastroesophageal reflux disease (≥1%)

Genitourinary: Dysuria (≥2%), ejaculation disorder/failure (≥2%), erectile dysfunction (≥2%), libido decreased (≥2%), prostatitis (≥2%), scrotal pain (≥2%), testicular pain (≥2%), testicular swelling (≥2%), urethral pain (≥2%), urinary hesitation (≥2%), urinary retention (≥2%), urine flow decreased (≥2%), cystitis (≥1%), urinary tract infection (≥1%)

Neuromuscular & skeletal: Falling (≥1%)

Ocular: Blurred vision (2%)

Respiratory: Dyspnea (2%)

Miscellaneous: Night sweats (≥1%)

<1%, postmarketing, and/or case reports: Accommodation disorder, acute renal failure, anorexia, delirium, erythema multiforme, galactorrhea, hallucination, hepatitis, hyperprolactinemia, hypertensive crisis, hyponatremia, leukopenia, loss of consciousness, neuroleptic malignant syndrome, neutropenia, parkinsonism, rhabdomyolysis, seizures, serotonin syndrome, Stevens-Johnson syndrome, supraventricular tachycardia, thrombocytopenia

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists: Serotonin/Norepinephrine Reuptake Inhibitors may enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Serotonin/Norepinephrine Reuptake Inhibitors may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk C: Monitor therapy*

Aspirin: Serotonin/Norepinephrine Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

ClomiPRAMINE: May enhance the adverse/toxic effect of Milnacipran. Specifically, the incidence of euphoria and postural hypotension were higher in patients changing from clomipramine to milnacipran. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Digoxin: Milnacipran may enhance the adverse/toxic effect of Digoxin. The risk of postural hypotension and tachycardia may be increased, particularly with IV digoxin. Management: Avoid concurrent use of intravenous (IV) digoxin in patients receiving milnacipran. Use caution when using oral digoxin and milnacipran together, monitoring closely for possible postural hypotension and tachycardia. *Risk D: Consider therapy modification*

Iobenguane I 123: Serotonin/Norepinephrine Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

NSAID (Nonselective): Serotonin/Norepinephrine Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol use.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava, tryptophan (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersBlood pressure and heart rate should be regularly monitored; renal function should be monitored for dosing purposes; mental status for suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); intraocular pressure should be monitored in those with baseline elevations or a history of glaucoma

Monitoring: Lab TestsRenal function should be monitored for dosing purposes

Product AvailabilitySavella™: FDA approved January 2009; availability anticipated in March 2009

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Savella™: 12.5 mg, 25 mg, 50 mg, 100 mg

Generic AvailableNo

ManufacturerForest Laboratories, Inc

Mechanism of ActionPotent inhibitor of norepinephrine and serotonin reuptake (3:1). Milnacipran has no significant activity for serotonergic, alpha- and beta-adrenergic, muscarinic, histaminergic, dopaminergic, opiate, benzodiazepine, and GABA receptors. It does not possess MAO-inhibitory activity.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: I.V: V_d: ~400 L

Protein binding: 13%

Metabolism: Hepatic to inactive metabolites

Bioavailability: 85% to 90%

Half-life elimination: 6-8 hours

Time to peak, plasma: Oral: 2-4 hours

Excretion: Urine (55% as unchanged drug)

- [Milrinone]()

Administration: I.V.Infuse via infusion pump.

Administration: I.V. DetailInjectable solution and premixed solution: pH: 3.2-4.0

StorageStore at 15°C to 30°C (59°F to 86°F). Avoid freezing. Stable at 0.2 mg/mL in $^1/_2$NS, NS, or D_5W for 72 hours at room temperature in normal light.

ReconstitutionStandard dilution: For a final concentration of 0.2 mg/mL: Dilute Primacor® 1 mg/mL (20 mL) with 80 mL diluent (final volume: 100 mL) of ½ NS, NS or D_5W. May also dilute 1 mg/mL (10 mL) with 40 mL diluent (final volume: 50 mL).

CompatibilityStable in D_5W, LR, $^1/_2$NS, NS.

Y-site administration: Compatible: Atracurium, bumetanide, calcium gluconate, cimetidine, digoxin, diltiazem, dobutamine, dopamine, epinephrine, fentanyl, heparin, hydromorphone, insulin (regular), isoproterenol, labetalol, lorazepam, magnesium sulfate, midazolam, morphine, nicardipine, nitroglycerin, norepinephrine, pancuronium, potassium chloride, propofol, propranolol, quinidine gluconate, ranitidine, rocuronium, sodium bicarbonate, sodium nitroprusside, theophylline, thiopental, torsemide, vecuronium. **Incompatible:** Furosemide, imipenem-cilastin, procainamide.

Compatibility in syringe: Compatible: Atropine, calcium chloride, digoxin, epinephrine, lidocaine, morphine, propranolol, sodium bicarbonate, verapamil. **Incompatible:** Furosemide.

Compatibility when admixed: Compatible: Quinidine gluconate. **Incompatible:** Bumetanide, furosemide, procainamide.

ContraindicationsHypersensitivity to milrinone, inamrinone, or any component of the formulation; concurrent use of inamrinone

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias: Observe for arrhythmias in this very high-risk patient population. Ventricular or atrial arrhythmias may persist even after discontinuation of inamrinone especially in patients with renal dysfunction. Ensure that ventricular rate is controlled in atrial fibrillation/flutter before initiating; may increase ventricular response rate. In heart transplant candidates, institute appropriate measures to protect patient against risks of sudden cardiac death.

- Hepatic effects: Discontinue therapy if dose-related elevations in LFTs and clinical symptoms of hepatotoxicity occur; monitor liver function.

- Hypotension: Monitor blood pressure/ heart rate closely. Mean arterial pressure decreases by ~5% at doses between 0.375-5 mcg/kg/minute and by 17% at 0.75 mcg/kg/minute (includes loading doses ranging between 37.5-75 mcg/kg). Infusion may require reduction in dose or temporary discontinuation if hypotension occurs. Hypotension may be prolonged especially in patients with renal dysfunction. Vigorous diuresis may contribute to hypotension; cautious administration of fluids may be required to prevent hypotension.

Disease-related concerns:

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.

- Myocardial infarction (MI): Not recommended in acute MI treatment.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended. Hypotension may be prolonged in patients with renal dysfunction.

Other warnings/precautions:

- Long-term therapy: According to the ACC/AHA chronic heart failure 2005 guidelines, long-term, regularly-scheduled intermittent infusions are strongly discouraged.

- Monitoring: Monitor fluid status closely; patients may require adjustment of diuretic and electrolyte replacement therapy.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%: Cardiovascular: Ventricular arrhythmia (ectopy 9%, NSVT 3%, sustained ventricular tachycardia 1%, ventricular fibrillation <1%)

1% to 10%:

Cardiovascular: Supraventricular arrhythmia (4%), hypotension (3%), angina/chest pain (1%)

Central nervous system: Headache (3%)

<1% (Limited to important or life-threatening): Atrial fibrillation, hypokalemia, MI, thrombocytopenia, tremor, ventricular fibrillation

Postmarketing and/or case reports: Anaphylaxis, bronchospasm, injection site reaction, liver function abnormalities, rash, torsade de pointes

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersPlatelet count, CBC, electrolytes (especially potassium and magnesium), liver function and renal function tests; ECG, CVP, SBP, DBP, heart rate; infusion site

If pulmonary artery catheter is in place, monitor cardiac index, stroke volume, systemic vascular resistance, pulmonary capillary wedge pressure and pulmonary vascular resistance.

Nursing: Physical Assessment/MonitoringUse infusion pump. Monitor cardiac/hemodynamic status continuously during therapy and serum potassium at regular intervals. Monitor for fluid retention.
Monitoring: Lab TestsPlatelet count, CBC, electrolytes (especially potassium and magnesium), liver function and renal function tests
Patient EducationThis drug can only be given intravenously. If you experience increased urination, call for assistance. Weigh daily; report weight gain of 3-5 pounds/week. Report pain at infusion site; numbness, tingling, or swelling of extremities; or respiratory difficulty.
Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Infusion [premixed in D_5W]: 200 mcg/mL (100 mL, 200 mL)

Primacor®: 200 mcg/mL (200 mL)

Injection, solution: 1 mg/mL (10 mL, 20 mL, 50 mL)

Generic AvailableYes
ManufacturerSanofi Winthrop Pharmaceuticals
Mechanism of ActionA selective phosphodiesterase inhibitor in cardiac and vascular tissue, resulting in vasodilation and inotropic effects with little chronotropic activity.
Pharmacodynamics/Kinetics

Onset of action: I.V.: 5-15 minutes

Distribution: V_{dss}: 0.32-0.45 L/kg

Protein binding, plasma: ~70%

Metabolism: Hepatic (12%)

Half-life elimination: ~2.5 hours

Excretion: Urine (85% as unchanged drug) within 24 hours; active tubular secretion is a major elimination pathway for milrinone

Related Information

- Hemodynamic Support, Intravenous

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentMay cause hypotension; concurrent use with a psychotropic may further this risk; monitor. May rarely cause thrombocytopenia; use caution with valproic acid; monitor.
Cardiovascular ConsiderationsMilrinone may be useful for severe CHF patients on a beta-blocker and require an I.V. inotrope. Long-term use of phosphodiesterase enzyme inhibitor therapy in heart failure provides some symptomatic relief but is associated with clear cut increases in mortality. Milrinone has been used for short-term improvement in hemodynamics. Chronic administration of milrinone does not confer beneficial effects on cardiovascular morbidity and mortality.
Anesthesia and Critical Care Concerns/Other ConsiderationsIf hypotension is a problem, loading doses may be omitted and maintenance infusions initiated. There is some delay in hemodynamic effects, but it is minimal (1-3 hours). Lower initial maintenance infusions have also been used (0.18-0.25 mcg/kg/minute).
Index TermsMilrinone Lactate

Mineral Oil

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(MIN er al oyl)

U.S. Brand NamesFleet® Mineral Oil Enema [OTC]; Kondremul® [OTC]; Liqui-Doss® [OTC] [DSC]

Pharmacologic CategoryLaxative, Lubricant

Use: Labeled IndicationsTemporary relief of occasional constipation, relief of fecal impaction; removal of barium sulfate residues following barium administration

Dosing: Adults

Constipation:

Oral: 15-45 mL/day

Kondremul®: 30-75 mL/day

Liqui-Doss®: 15-45 mL at bedtime

Rectal (Fleet® Mineral Oil): 118 mL as a single dose

Fecal impaction or following barium studies: Rectal (Fleet® Mineral Oil): 118 mL as a single dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Constipation:

Oral:

Children ≥1 year (practice guidelines):

Disimpaction: 15-30 mL per year of age; maximum 240 mL/day

Maintenance: 1-3 mL/kg/day; adjust to induce daily bowel movement for 1-2 months

Children 6-11 years:

Kondremul®: 10-25 mL/day

Liqui-Doss®: 5-15 mL at bedtime

Children ≥12 years: Refer to adult dosing.

Rectal (Fleet® Mineral Oil):

Children 2-12 years: 59 mL as a single dose

Children ≥12 years: Refer to adult dosing.

Fecal impaction or following barium studies: Rectal (Fleet® Mineral Oil):

Children 2-12 years: 59 mL as a single dose

Children ≥12 years: Refer to adult dosing.

Administration: Oral Oral: Mineral oil may be more palatable if refrigerated. Administer on an empty stomach in an upright position.

Kondremul®: Shake well before use.

Liqui-Doss®: Shake well before use. Prior to use, mix with 120 mL of any beverage; administer only at bedtime.

Administration: OtherRectal (Fleet® Mineral Oil): Gently insert enema rectally with patient lying on left side and left knee slightly bent, right knee drawn to chest.

Dietary ConsiderationsDo not administer with food or meals because of the risk of aspiration; prolonged administration of mineral oil may decrease absorption of lipid-soluble vitamins A, D, E, and K. Light sterile mineral oils are not for injection.

ContraindicationsPatients with colostomy or an ileostomy, appendicitis, ulcerative colitis, diverticulitis

Warnings/Precautions

Concerns related to adverse effects:

- Aspiration: Lipid pneumonitis results from aspiration of mineral oil; risk is increased in patients in prolonged supine position or conditions which interfere with swallowing or epiglottal function (eg, stroke, Parkinson's disease, Alzheimer's disease, esophageal dysmotility).

Other warnings/precautions:

- OTC labeling: Healthcare provider should be contacted in case of sudden changes in bowel habits which last over 2 weeks or if abdominal pain, nausea, vomiting, or rectal bleeding occur following use; do not use for >1 week, unless otherwise directed by healthcare provider. Do not use orally in children <6 years of age or rectally in children <2 years of age.

Geriatric Considerations Other therapies should be attempted before using mineral oil to relieve constipation to avoid complications with mineral oil; doses, if used, should begin low and should be used as infrequently as possible.

Adverse Reactions Frequency not defined.

Gastrointestinal: Abdominal cramps, diarrhea, nausea, vomiting

Respiratory: Lipid pneumonitis with aspiration

Miscellaneous: Large doses may cause anal leakage causing anal itching, irritation, hemorrhoids, perianal discomfort, soiling of clothes

Drug Interactions There are no known significant interactions.

Monitoring Parameters Monitor for response (stool frequency, consistency). Avoid use in patients who may aspirate.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, oral:

Liqui-Doss®: 13.5 mL/15 mL (480 mL) [self-emulsifying oily liquid; alcohol free, sugar free] [DSC]

Microemulsion, oral:

Kondremul®: 2.5 mL/5 mL (480 mL) [sugar free; mint flavor]

Oil, rectal [enema]:

Fleet® Mineral Oil: 100% (118 mL)

Oil, oral: 100% (30 mL, 480 mL, 3840 mL)

Oil, topical: 100% (480 mL) [light]

Generic Available Yes: Oral oil

Mechanism of Action Eases passage of stool by decreasing water absorption and lubricating the intestine; retards colonic absorption of water

Pharmacodynamics/Kinetics

Onset of action: Oral: 6-8 hours; Rectal: 2-15 minutes

Distribution: Site of action is the colon

Excretion: Feces

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Patients with Parkinson's and Alzheimer's disease who have difficulty swallowing and are at an increased risk for aspiration may develop lipid pneumonitis.

Index Terms Heavy Mineral Oil; Liquid Paraffin; White Mineral Oil

Minocycline Hydrochloride Periodontal Microspheres

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation

(mi noe SYE kleen hye droe KLOR ide pair ee oh DON tol MI kro SFEERS)

U.S. Brand NamesArestin®
Pharmacologic CategoryAntibiotic, Tetracycline Derivative
Use: DentalAdjunct to scaling and root planing procedures for reduction of pocket depth in patients with adult periodontitis. May be used as part of a periodontal maintenance program which includes good oral hygiene, scaling, and root planing.
Dosing: AdultsVariable-dose product; dependent upon the size, shape, and number of pockets being treated
Dosing: ElderlyRefer to adult dosing.
Administration: OralAdministration of Arestin® does not require local anesthesia. Professional subgingival administration is accomplished by inserting the unit-dose cartridge to the base of the periodontal pocket and then pressing the thumb ring in the handle mechanism to expel the powder while gradually withdrawing the tip from the base of the pocket. The handle mechanism should be sterilized between patients. Arestin® does not have to be removed (it is bioresorbable) nor is an adhesive dressing required.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Avoid excessive heat.
ContraindicationsKnown hypersensitivity to minocycline, tetracyclines, or any component of the formulation
Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Autoimmune syndromes: Lupus-like, hepatitis, and vasculitis autoimmune syndromes have been reported with oral minocycline use; no further treatment should be given if symptoms occur.
- Hypersensitivity reactions: Anaphylaxis, angioneurotic edema, urticaria, rash, swelling of the face, and pruritus have been reported.
- Photosensitivity: May cause photosensitivity; discontinue if skin erythema occurs. Use skin protection and avoid prolonged exposure to sunlight; do not use tanning equipment.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Special populations:

- Pediatrics: May cause tissue hyperpigmentation, enamel hypoplasia, or permanent tooth discoloration; use of tetracyclines should be avoided during tooth development (children ≤8 years of age) unless other drugs are not likely to be effective or are contraindicated.
- Pregnancy: Do not use during pregnancy. In addition to affecting tooth development, tetracycline use has been associated with retardation of skeletal development and reduced bone growth.

Other warnings/precautions:

- Appropriate use: Use in an acutely abscessed periodontal pocket has not been studied and is not recommended. The effects of treatment for >6 months have not been studied. Should be used with caution in patients having a history of predisposition to oral candidiasis. Safety and effectiveness have not been established for the treatment of periodontitis in patients with coexistent oral candidiasis. Not clinically tested in immunocompromised patients (such as those immunocompromised by diabetes, chemotherapy, radiation therapy, or infection with HIV). Not clinically tested for use in the regeneration of alveolar bone, either in preparation for or in conjunction with the placement of endosseous (dental) implants or in the treatment of failing implants.

Pregnancy Risk FactorD
Pregnancy ConsiderationsRefer to Warnings/Precautions.
LactationEnters breast milk/not recommended
Adverse Reactions

>10%: Gastrointestinal: Tooth disorder (12%)

1% to 10%:

Central nervous system: Headache (9%), pain (4%)

Gastrointestinal: Dental caries (10%), dental pain (10%), gingivitis (9%), mouth ulceration (5%), dyspepsia (4%), mucous membrane disorder (3%)

Respiratory: Pharyngitis (4%)

Miscellaneous: Infection (8%), flu-like syndrome (5%)

Postmarketing and/or case reports: Anaphylaxis, angioneurotic edema, erythema multiforme (oral minocycline), pruritus, rash, Stevens-Johnson syndrome (oral minocylcine), swelling of face, urticaria

Patient Education

Report persistent diarrhea.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder, sustained release [microspheres for subgingival application]:

Arestin®: 1 mg (12s) [each unit-dose cartridge delivers minocycline hydrochloride equivalent to minocycline free base 1 mg]

Generic AvailableNo

Mechanism of ActionMinocycline, a member of the tetracycline class of antibiotics, has a broad spectrum of activity. It is bacteriostatic and exerts its antimicrobial activity by inhibiting protein synthesis.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Patients should avoid the following postadministration: Eating hard, crunchy, or sticky foods for 1 week; brushing for a 12-hour period; touching treated areas; use of interproximal cleaning devices for 10 days.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Minocycline

Lexi-Drugs Online

English English

Medication Safety Issues

Sound-alike/look-alike issues:

Dynacin® may be confused with Dyazide®, Dynabac®, DynaCirc®, Dynapen®

Minocin® may be confused with Indocin®, Lincocin®, Minizide®, Mithracin®, niacin

Pronunciation(mi noe SYE kleen)
U.S. Brand NamesDynacin®; Minocin® PAC; myrac™; Solodyn™
Canadian Brand NamesAlti-Minocycline; Apo-Minocycline®; Gen-Minocycline; Minocin®; Novo-Minocycline; PMS-Minocycline; Rhoxal-minocycline; Sandoz-Minocycline
Pharmacologic CategoryAntibiotic, Tetracycline Derivative
Use: Labeled IndicationsTreatment of susceptible bacterial infections of both gram-negative and gram-positive organisms; treatment of anthrax (inhalational, cutaneous, and gastrointestinal); moderate-to-severe acne; meningococcal (asymptomatic) carrier state; Rickettsial diseases (including Rocky Mountain spotted fever, Q fever); nongonococcal urethritis, gonorrhea; acute intestinal amebiasis

Extended release (Solodyn™): Only indicated for treatment of inflammatory lesions of non-nodular moderate-to-severe acne

Use: Unlabeled/InvestigationalRheumatoid arthritis (patients with low disease activity of short duration)
Dosing: Adults

Usual dosage range: Oral: Initial: 200 mg, followed by 100 mg every 12 hours; more frequent dosing intervals may be used (100-200 mg initially, followed by 50 mg 4 times daily)

Acne: Oral: Capsule or immediate-release tablet: 50-100 mg twice daily

Inflammatory, non-nodular, moderate-to-severe acne (Solodyn™):

45-59 kg: 45 mg once daily

60-90 kg: 90 mg once daily

91-136 kg: 135 mg once daily

Note: Therapy should be continued for 12 weeks. Higher doses do not confer greater efficacy, and safety of use beyond 12 weeks has not been established.

Chlamydial or*Ureaplasma urealyticum*infection, uncomplicated: Urethral, endocervical, or rectal: Oral: 100 mg every 12 hours for at least 7 days

Gonococcal infection, uncomplicated (males): Oral:

Without urethritis or anorectal infection: Initial: 200 mg, followed by 100 mg every 12 hours for at least 4 days (cultures 2-3 days post-therapy)

Urethritis: 100 mg every 12 hours for 5 days

Meningococcal carrier state: Oral: 100 mg every 12 hours for 5 days

Mycobacterium marinum: Oral: 100 mg every 12 hours for 6-8 weeks

Nocardiosis, cutaneous (non-CNS): Oral: 100 mg every 12 hours

Rheumatoid arthritis (unlabeled use): 100 mg twice daily (O'Dell, 2001)

Syphilis: Oral: Initial: 200 mg, followed by 100 mg every 12 hours for 10-15 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Usual dosage range: Children >8 years: Oral: Initial: 4 mg/kg followed by 2 mg/kg/dose every 12 hours

Inflammatory, non-nodular, moderate-to-severe acne (Solodyn™): Children ≥12 years: Oral: Refer to adult dosing.

Dosing: Renal ImpairmentUse with caution; monitor BUN and creatinine clearance. Consider decreasing dose or increasing dosing interval (extended release).
Administration: OralMay be taken with or without food. Administer with adequate fluid to decrease the risk of esophageal irritation and ulceration. Swallow pellet-filled capsule and extended release tablet whole; do not chew, crush, or split.
Dietary ConsiderationsMay be taken with or without food.

Storage

Capsule (including pellet-filled), tablet: Store at 20°C to 25°C (68°F to 77°F); protect from heat. Protect from light and moisture.

Extended release tablet: Store at 15°C to 30°C (59°F to 86°F); protect from heat. Protect from light and moisture.

ContraindicationsHypersensitivity to minocycline, other tetracyclines, or any component of the formulation

Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Autoimmune syndromes: Lupus-like, hepatitis, and vasculitis autoimmune syndromes have been reported; discontinue if symptoms.
- CNS effects: Lightheadedness and vertigo may occur; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Increased BUN: May be associated with increases in BUN secondary to antianabolic effects; use caution in patients with renal impairment.
- Photosensitivity: May cause photosensitivity; discontinue if skin erythema occurs. Use skin protection and avoid prolonged exposure to sunlight; do not use tanning equipment.
- Pseudotumor cerebri: Has been (rarely) reported with tetracycline use; usually resolves with discontinuation.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Hepatotoxicity has been reported; use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment (Cl_{cr} <80 mL/minute).

Special populations:

- Pediatrics: May cause tissue hyperpigmentation, enamel hypoplasia, or permanent tooth discoloration; use of tetracyclines should be avoided during tooth development (children ≤8 years of age) unless other drugs are not likely to be effective or are contraindicated. However, recommended in treatment of anthrax exposure.
- Pregnancy: Do not use during pregnancy. In addition to affecting tooth development, tetracycline use has been associated with retardation of skeletal development and reduced bone growth.
- Rheumatoid arthritis (unlabeled/investigational): Contraindicated in pregnancy and breast-feeding; Child-Pugh Class C and acute hepatitis B and C. (Saag KG, 2008)

Geriatric ConsiderationsMinocycline has not been studied in the elderly but its CNS effects may limit its use. Dose reduction for renal function not necessary.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTetracyclines, including minocycline, cross the placenta, enter fetal circulation, and may cause permanent discoloration of teeth if used during the second or third trimester. Congenital anomalies after minocycline use have been reported postmarketing. Because use during pregnancy may cause fetal harm, minocycline is classified as pregnancy category D.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSmall amounts of minocycline are excreted in breast milk and therefore, breast-feeding is not recommended by the manufacturer. Minocycline absorption is not affected by dairy products. This may lead to increased absorption from maternal milk when compared to other tetracyclines which are bound by the calcium in the maternal milk. Nondose-related effects could include modification of bowel flora. There have been case reports of black discoloration of breast milk in women taking minocycline.

Pregnancy & Lactation, In-Depth

- Minocycline in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Myocarditis, pericarditis, vasculitis

Central nervous system: Bulging fontanels, dizziness, fatigue, fever, headache, hypoesthesia, malaise, mood changes, paresthesia, pseudotumor cerebri, sedation, seizure, somnolence, vertigo

Dermatologic: Alopecia, angioedema, erythema multiforme, erythema nodosum, erythematous rash, exfoliative dermatitis, hyperpigmentation of nails, maculopapular rash, photosensitivity, pigmentation of the skin and mucous membranes, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Thyroid discoloration, thyroid dysfunction

Gastrointestinal: Anorexia, diarrhea, dyspepsia, dysphagia, enamel hypoplasia, enterocolitis, esophageal ulcerations, esophagitis, glossitis, inflammatory lesions (oral/anogenital), moniliasis, nausea, oral cavity discoloration, pancreatitis, pseudomembranous colitis, stomatitis, tooth discoloration, vomiting, xerostomia

Genitourinary: Balanitis, vulvovaginitis

Hematologic: Agranulocytosis, eosinophilia, hemolytic anemia, leukopenia, neutropenia, pancytopenia, thrombocytopenia

Hepatic: Hepatic cholestasis, hepatic failure, hepatitis, hyperbilirubinemia, jaundice, liver enzyme increases

Neuromuscular & skeletal: Arthralgia, arthritis, bone discoloration, joint stiffness, joint swelling, myalgia

Otic: Hearing loss, tinnitus

Renal: Acute renal failure, BUN increased, interstitial nephritis

Respiratory: Asthma, bronchospasm, cough, dyspnea, pneumonitis, pulmonary infiltrate (with eosinophilia)

Miscellaneous: Anaphylaxis, hypersensitivity, lupus erythematosus, lupus-like syndrome, serum sickness

Drug Interactions

Antacids: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth Subsalicylate: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Tetracycline Derivatives may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Penicillins: Tetracycline Derivatives may diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Quinapril: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: Tetracycline Derivatives may enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Tetracycline Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern when both products are administered orally. **Exceptions:** Zinc Chloride. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Minocycline serum concentrations are not significantly altered if taken with food or dairy products.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsMay cause interference with fluorescence test for urinary catecholamines (false elevations)

Monitoring ParametersCulture and sensitivity testing prior to initiating therapy; LFTs, BUN, renal function with long-term treatment; if symptomatic for autoimmune disorder, include ANA, CBC

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and allergy history before beginning therapy. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, warfarin, antacids, hydantoins, carbamazepine). Assess therapeutic effectiveness (resolution of infection) and adverse reactions on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity testing prior to initiating therapy; LFTs, BUN, renal function with long-term treatment; if symptomatic for autoimmune disorder, include ANA, CBC monitoring.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; may be taken with or without food. Do not chew, break, or dissolve extended release tablet. Complete full course of therapy; do not discontinue even if condition is resolved. May cause photosensitivity reaction (avoid sun, use sunscreen, or wear protective clothing); nausea (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (boiled milk, buttermilk, or yogurt may help). Report rash or itching, unresolved or persistent nausea or diarrhea, change in urinary output (excess); or opportunistic infection (eg, fever, chills, sore throat, burning urination, fatigue). **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: 50 mg, 75 mg, 100 mg

90 mg (100): $1901.74

Tablets (Dynacin)

75 mg (30): $300.74

100 mg (30): $364.53

Tablets (Minocycline HCl)

75 mg (30): $143.99

100 mg (50): $189.99

Tablets (Myrac)

100 mg (50): $222.00

Mechanism of ActionInhibits bacterial protein synthesis by binding with the 30S and possibly the 50S ribosomal subunit(s) of susceptible bacteria; cell wall synthesis is not affected

Rheumatoid arthritis: The mechanism of action of minocycline in rheumatoid arthritis is not completely understood. It is thought to have antimicrobial, antiinflammatory, immunomodulatory, and chondroprotective effects. More specifically, it is thought to be a potent inhibitor of metalloproteinases, which are active in rheumatoid arthritis joint destruction.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Protein binding: 70% to 75%

Metabolism: Hepatic to inactive metabolites

Half-life elimination: 16 hours (range: 11-22 hours)

Time to peak: Capsule, pellet filled: 1-4 hours; Extended release tablet: 3.5-4 hours

Excretion: Urine, feces

Related Information

- Antimicrobial Drugs of Choice
- Community-Acquired Pneumonia in Adults

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Discoloration of teeth (children). Opportunistic “superinfection” with *Candida albicans*; tetracyclines are not recommended for use during pregnancy or in children ≤8 years of age since they have been reported to cause enamel hypoplasia and permanent teeth discoloration. The use of tetracycline's should only be used in these patients if other agents are contraindicated or alternative antimicrobials will not eradicate the organism. Long-term use associated with oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Psychiatric Treatment Barbiturates and carbamazepine may decrease the effects of tetracyclines; tetracyclines may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels. No data documenting these effects with minocycline; use caution.

Index Terms Minocycline Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Minoxidil may be confused with metolazone, midodrine, Minipress®, Minocin®, Monopril®, Noxafil®

International issues:

Noxidil® [Thailand] may be confused with Noxafil® which is a brand name for posaconazole in the U.S.

Pronunciation(mi NOKS i dil)

U.S. Brand NamesRogaine® Extra Strength for Men [OTC]; Rogaine® for Men [OTC]; Rogaine® for Women [OTC]

Canadian Brand NamesApo-Gain®; Loniten®; Minox; Rogaine®

Pharmacologic CategoryTopical Skin Product; Vasodilator, Direct-Acting

Use: Labeled IndicationsManagement of severe hypertension (usually in combination with a diuretic and beta-blocker); treatment (topical formulation) of alopecia androgenetica in males and females

Dosing: Adults

Hypertension: Oral: Initial: 5 mg once daily, increase gradually every 3 days (maximum: 100 mg/day); usual dosage range (JNC 7): 2.5-80 mg/day in 1-2 divided doses

Note: Dosage adjustment is needed when added to concomitant therapy.

Alopecia: Topical: Apply twice daily; 4 months of therapy may be necessary for hair growth.

Dosing: ElderlyHypertension: Initial: 2.5 mg once daily; increase gradually.

Dosing: Pediatric

Hypertension: Oral:

Children <12 years: Initial: 0.1-0.2 mg/kg once daily; maximum: 5 mg/day; increase gradually every 3 days; usual dosage range: 0.25-1 mg/kg/day in 1-2 divided doses; maximum: 50 mg/day

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentPatient with renal failure and/or receiving dialysis may require dosage reduction.

Supplemental dose is not necessary via hemo- or peritoneal dialysis.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to minoxidil or any component of the formulation; pheochromocytoma

Warnings/Precautions

Boxed warnings:

- Appropriate use: See "Other warnings/precautions" below.
- Pericardial effusion/tamponade: See "Concerns related to adverse effects" below.
- Sinus tachycardia: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fluid retention: May cause salt and water retention; administer with a diuretic, preferably a loop diuretic (eg, furosemide) to prevent fluid retention and subsequent local and generalized edema. Use with extreme caution in patients with heart failure.
- Hypertrichosis: Inform patients of excessive hair growth patterns before initiating therapy; may take 1-6 months for hypertrichosis to reverse itself after discontinuation of the drug.
- Pericardial effusion/tamponade: **[U.S. Boxed Warning]: May cause pericarditis and pericardial effusion that may progress to tamponade;** patients with renal impairment not on dialysis may be at higher risk. Use with caution in patients with heart failure. Observe patients closely.
- Rapid blood pressure control: Rapid control of blood pressure in patients with severe hypertension can lead to syncope, CVA, MI, and/or ischemia of other special sense organs (eg, vision).

- Sinus tachycardia: **[U.S. Boxed Warning]: May increase oxygen demand and exacerbate angina pectoris;** concomitant use with a beta-blocker (if no contraindication exists) may help reduce the effect. Use with caution in patients with ischemic heart disease.

Disease-related concerns:

- Acute myocardial infarct (MI): Avoid use for a month after acute MI. Use with extreme caution; ensure patient is receiving a beta blocker prior to initiation.
- Heart failure: Compared to placebo minoxidil increased the frequency of clinical events, including increased need for diuretics, angina, ventricular arrhythmias, worsening heart failure and death (Franciosa, 1984).
- Renal impairment: Use with caution in patients with significant renal impairment; renal failure and dialysis patients may require a smaller dose.

Special populations:

- Elderly: Use with caution in the elderly; initiate at the low end of the dosage range and monitor closely.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Maximum therapeutic doses of a diuretic and two antihypertensives should be used before this drug is ever added. Should be given with a diuretic to minimize fluid gain and a beta-blocker (if no contraindications) to prevent tachycardia. Anyone with malignant hypertension should be hospitalized with close medical supervision to ensure blood pressure is reducing and to prevent too rapid of a reduction in blood pressure.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsExcretion in breast milk has been reported in one case report of a woman receiving 10 mg/day orally.

Adverse Reactions

Oral: Incidence of reactions not always reported.

Cardiovascular: ECG changes (T-wave changes 60%), peripheral edema (7%), pericardial effusion with tamponade (3%), pericardial effusion without tamponade (3%), angina pectoris, heart failure, pericarditis, rebound hypertension (in children after a gradual withdrawal), sodium and water retention, tachycardia

Dermatologic: Hypertrichosis (common; 80%), bullous eruption (rare), rash, Stevens-Johnson syndrome (rare)

Endocrine & metabolic: Breast tenderness (rare; <1%)

Gastrointestinal: Nausea, vomiting, weight gain

Hematologic: Leukopenia (rare), thrombocytopenia (rare), transient decreased erythrocyte count (hemodilution), transient decreased hematocrit/hemoglobin (hemodilution)

Hepatic: Alkaline phosphatase increased

Renal: Serum BUN/creatinine increased (transient)

Respiratory: Pulmonary edema

Topical: Incidence of adverse events is not always reported.

Cardiovascular: Blood pressure increased/decreased, cardiac output increased, chest pain (transient), edema, left ventricular mass increased, left ventricular end-diastolic volume increased, palpitation, tachycardia

Central nervous system: Anxiety (rare), dizziness, faintness, headache, mental depression (rare), taste alterations

Dermatologic: Allergic contact dermatitis (7.4%), alopecia, dryness, eczema, exacerbation of hair loss, flushing, folliculitis; hair growth increased outside the area of application (face, beard, eyebrows, ear, arm); hypertrichosis, local erythema, papular rash, pruritus, scaling/flaking, seborrhea

Endocrine & metabolic: Menstrual changes

Gastrointestinal: Diarrhea, nausea

Genitourinary: Epididymitis (rare), impotence (rare), prostatitis (rare), renal calculi (rare), urethritis (rare), urinary tract infection (rare)

Hematologic: Lymphadenopathy, thrombocytopenia

Neuromuscular & skeletal: Back pain, fractures, retrosternal chest pain of muscular origin, tendonitis (2.6%), weakness

Ocular: Conjunctivitis, visual acuity decreased, visual disturbances

Respiratory: Bronchitis, upper respiratory infection

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can

not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

CycloSPORINE: May enhance the adverse/toxic effect of Minoxidil. Severe hypertrichosis has been reported. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice may diminish the antihypertensive effects of minoxidil. Black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse may enhance the hypotensive effects of minoxidil.

Monitoring ParametersBlood pressure, standing and sitting/supine; fluid and electrolyte balance and body weight should be monitored. Any tests that are abnormal at the time of initiation (including, renal function tests, ECG, echocardiogram, chest x-ray) should be repeated initially every 1-3 months then every 6-12 months once stable.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, topical [foam]:

Rogaine for Men®: 5% (60 g)

Solution, topical: 2% (60 mL); 5% (60 mL)

Rogaine® for Men: (60 mL) [DSC] [supplied with dropper applicator]

Rogaine® for Women: 2% (60 mL) [supplied with dropper applicator]

Rogaine® Extra Strength for Men: 5% (60 mL) [supplied with dropper applicator]

Tablet: 2.5 mg, 10 mg

Generic AvailableYes: Excludes aerosol, topical solution

Pricing: U.S. (www.drugstore.com)

Solution (Rogaine)

2% (60): $22.44

2% (180): $45.77

Solution (Rogaine Extra Strength for Men)

5% (60): $29.71

Tablets (Minoxidil)

2.5 mg (60): $19.99

10 mg (90): $53.99

Mechanism of ActionProduces vasodilation by directly relaxing arteriolar smooth muscle, with little effect on veins; effects may be mediated by cyclic AMP; stimulation of hair growth is secondary to vasodilation, increased cutaneous blood flow and stimulation of resting hair follicles

Pharmacodynamics/Kinetics

Onset of action: Hypotensive: Oral: ~30 minutes

Peak effect: 2-8 hours

Duration: 2-5 days

Protein binding: None

Metabolism: 88%, primarily via glucuronidation

Bioavailability: Oral: 90%

Half-life elimination: Adults: 3.5-4.2 hours

Excretion: Urine (12% as unchanged drug)

Related Information

- Hypertension

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine

Medication Safety Issues

Sound-alike/look-alike issues:

Remeron® may be confused with Premarin®, ramelteon, Rozerem®, Zemuron®

International issues:

Avanza® [Australia] may be confused with Albenza® which is a brand name for albendazole in the U.S.

Avanza® [Australia] may be confused with Avandia® which is a brand name for rosiglitazone in the U.S.

Remeron® my be confused with Reneuron® which is a brand name for fluoxetine in Spain

Pronunciation(mir TAZ a peen)

U.S. Brand NamesRemeron SolTab®; Remeron®

Canadian Brand NamesApo-Mirtazapine; CO Mirtazapine; DOM-Mirtazapine; Gen-Mirtazapine; Novo-Mirtazapine; PHL-Mirtazapine; PMS-Mirtazapine; PRO-Mirtazapine; ratio-Mirtazapine; Remeron®; Remeron® RD; Riva-Mirtazapine; Sandoz-Mirtazapine; Sandoz-Mirtazapine FC

Pharmacologic CategoryAntidepressant, Alpha-2 Antagonist

Use: Labeled IndicationsTreatment of depression

Dosing: AdultsDepression: Oral: Initial: 15 mg nightly, titrate up to 15-45 mg/day with dose increases made no more frequently than every 1-2 weeks. There is an inverse relationship between dose and sedation.

Dosing: ElderlyInitial: 7.5 mg/day as a single bedtime dose; increase by 7.5-15 mg/day every 1-2 weeks; usual dose: 15-30 mg/day; maximum dose: 45 mg/day

Alzheimer's dementia-related depression: Initial: 7.5 mg at bedtime; may increase at 7.5-15 mg increments to 45-60 mg/day

Dosing: Renal Impairment

Cl_{cr} 11-39 mL/minute: 30% decreased clearance

Cl_{cr} <10 mL/minute: 50% decreased clearance

Dosing: Hepatic ImpairmentClearance is decreased by 30%.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsRemeron SolTab® contains phenylalanine: 2.6 mg per 15 mg tablet; 5.2 mg per 30 mg tablet; 7.8 mg per 45 mg tablet

StorageStore at controlled room temperature.

SolTab®: Protect from light and moisture. Use immediately upon opening tablet blister.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to mirtazapine or any component of the formulation; use of MAO inhibitors within 14 days

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See "Major psychiatric warnings" below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Mirtazapine is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Mirtazapine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is low relative to other antidepressants.

- Blood dyscrasias: Discontinue immediately if signs and symptoms of neutropenia/agranulocytosis occur.

- Hyperlipidemia: May increase serum cholesterol and triglyceride levels.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is low relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is moderate to high relative to other antidepressants.

- Sexual dysfunction: The incidence of sexual dysfunction with mirtazapine is generally lower than with SSRIs.

- Weight gain: May increase appetite and stimulate weight gain. Weight gain of >7% of body weight reported in 7.5% of patients treated with mirtazapine compared to 0% for placebo; 8% of patients receiving mirtazapine discontinued treatment due to the weight gain. In an 8-week pediatric clinical trial, 49% of mirtazapine-treated patients had a weight gain of at least 7% (mean increase 4 kg) as compared to 5.7% of placebo-treated patients (mean increase 1 kg).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Dosage form specific issues:

- Phenylalanine: SolTab® formulation contains phenylalanine.

Geriatric ConsiderationsLimited published data specifically in the elderly or addressing *in vivo* drug interactions.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in some animal studies; therefore, the manufacturer classifies mirtazapine as pregnancy category C. A significant increase in major teratogenic effects has not been observed in humans following exposure to mirtazapine during pregnancy; however, some nonteratogenic adverse events (similar to those observed with SSRI agents) have been reported. Mirtazapine was found to cross the placenta following a maternal overdose. Pregnancy itself does not provide “protection” against depression. Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with antidepressants during pregnancy be individualized. According to their recommendations, treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary care provider, and pediatrician. If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done, and the woman is considered to be at risk of relapse from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationExcreted in breast milk/use caution

Breast-Feeding ConsiderationsMirtazapine and its active metabolite are found in breast milk, with higher levels in the hindmilk than foremilk. Adverse events have not been observed in nursing infants. The manufacturer recommends that caution be used if administered to a breast-feeding woman.

Pregnancy & Lactation, In-Depth

- Mirtazapine in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Somnolence (54%)

Endocrine & metabolic: Cholesterol increased

Gastrointestinal: Xerostomia (25%), appetite increased (17%), constipation (13%), weight gain (12%; weight gain of >7% reported in 8% of adults, ≤49% of pediatric patients)

1% to 10%:

Cardiovascular: Peripheral edema (2%), edema (1%), hypertension, vasodilatation

Central nervous system: Dizziness (7%), abnormal dreams (4%), abnormal thoughts (3%), confusion (2%), malaise

Endocrine & metabolic: Triglycerides increased

Gastrointestinal: Abdominal pain, anorexia, vomiting

Genitourinary: Urinary frequency (2%)

Neuromuscular & skeletal: Weakness (8%), back pain (2%), myalgia (2%), tremor (2%), arthralgia

Respiratory: Dyspnea (1%)

Miscellaneous: Flu-like syndrome (5%), thirst

<1%: Abdomen enlarged, abnormal ejaculation, accommodation abnormality, acne, agitation, agranulocytosis, akathisia, alopecia, amenorrhea, amnesia, anemia, angina pectoris, anxiety, apathy, aphasia, aphthous stomatitis, arthrosis, arthritis, asphyxia, asthma, ataxia, atrial arrhythmia, bigeminy, blepharitis, bone pain, bradycardia, breast engorgement, breast enlargement, breast pain, bronchitis, bursitis, cardiomegaly, cellulitis, cerebral ischemia, chest pain, chills, cholecystitis, cirrhosis, colitis, conjunctivitis, coordination abnormal, cough, cystitis, deafness, dehydration, delirium, delusions, dementia, depersonalization, depression, diabetes mellitus, diplopia, drug dependence, dry skin, dysarthria, dyskinesia, dysmenorrhea, dystonia, dysuria, ear pain, emotional lability, epistaxis, eructation, euphoria, exfoliative dermatitis, extrapyramidal syndrome, eye pain, facial edema, fever, fracture, gastritis, gastroenteritis, glaucoma, glossitis, goiter, gout, grand mal seizure, gum hemorrhage, hallucinations, hematuria, herpes simplex, herpes zoster, hiccup, hostility, hypokinesia, hyperacusis, hyperkinesias, hypoesthesia, hypotension, hypothyroidism, hypotonia, impotence, increased salivation, intestinal obstruction, keratoconjunctivitis, kidney calculus, lacrimation disorder, laryngitis, left heart failure, leukopenia, leukorrhea, libido increased, liver function tests abnormal, lymphadenopathy, lymphocytosis, manic reaction, menorrhagia, metrorrhagia, migraine, MI, myoclonus, myositis, nausea, neck pain, neck rigidity, neurosis, nystagmus, oral moniliasis, osteoporosis, otitis media, pancreatitis, pancytopenia, paralysis, paranoid reaction, paresthesia, parosmia, petechia, phlebitis, photosensitivity reaction, pneumonia, pneumothorax, polyuria, pruritus, psychotic depression, pulmonary embolus, rash, reflexes increased, salivary gland enlargement, seborrhea, sinusitis, skin hypertrophy, skin ulcer, stomatitis, stupor, syncope, taste loss, tendon rupture, tenosynovitis, thrombocytopenia, tongue discoloration, tongue edema, twitching, ulcer, ulcerative stomatitis, urethritis, urinary incontinence, urinary retention, urinary tract infection, urinary urgency, urticaria, vaginitis, vascular headache, ventricular extrasystoles, vertigo, weight loss, withdrawal syndrome

Postmarketing and/or case reports: Torsade de pointes (1 case reported)

Metabolism/Transport Effects

Substrate of CYP1A2 (major), 2C9 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha2-Agonists: Antidepressants (Alpha2-Antagonist) may diminish the hypotensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid St John's wort (may decrease mirtazapine levels). Avoid valerian, St John's wort, SAMe, kava kava (may increase CNS depression).

Monitoring ParametersPatients should be monitored for signs of agranulocytosis or severe neutropenia such as sore throat, stomatitis or other signs of infection or a low WBC; mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; lipid profile

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Has potential for psychological or physiological dependence, abuse, or tolerance. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for CNS depression/sedation. Monitor for clinical worsening and suicidal ideation. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Take once-a-day dose at bedtime. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, anorexia, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or orthostatic hypotension (use caution when climbing stairs or changing position from lying or sitting to standing). Report persistent insomnia, agitation, or confusion; suicidal ideation; muscle cramping, tremors, weakness, or change in gait; breathlessness or respiratory difficulty; chest pain, palpitations, or rapid heartbeat; change in urinary pattern; vision changes or eye pain; yellowing of eyes or skin; pale stools/dark urine; or worsening of condition.

SolTab®: Open blister pack and place tablet on the tongue. Do not split tablet. Tablet is formulated to dissolve on the tongue without water.

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 7.5 mg, 15 mg, 30 mg, 45 mg

Remeron®: 15 mg, 30 mg, 45 mg

Tablet, orally disintegrating: 15 mg, 30 mg

Remeron SolTab®:

15 mg [contains phenylalanine 2.6 mg/tablet; orange flavor]

30 mg [contains phenylalanine 5.2 mg/tablet; orange flavor]

45 mg [contains phenylalanine 7.8 mg/tablet; orange flavor]

Generic AvailableYes

Mechanism of Action Mirtazapine is a tetracyclic antidepressant that works by its central presynaptic alpha$_2$-adrenergic antagonist effects, which results in increased release of norepinephrine and serotonin. It is also a potent antagonist of 5-HT$_2$ and 5-HT$_3$ serotonin receptors and H1 histamine receptors and a moderate peripheral alpha$_1$-adrenergic and muscarinic antagonist; it does not inhibit the reuptake of norepinephrine or serotonin.

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: 4.5 L/kg

Protein binding: 85%

Metabolism: Extensively hepatic via CYP1A2, 2C9, 2D6, 3A4 and via demethylation (forms demethylmirtazapine, an active metabolite) and hydroxylation (forms inactive metabolites)

Bioavailability: 50%

Half-life elimination: 20-40 hours; hampered with renal or hepatic impairment

Time to peak, serum: 2 hours

Excretion: Urine (75%) and feces (15%) as metabolites

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile

Pharmacotherapy Pearls **Note:** At least 14 days should elapse between discontinuation of an MAO inhibitor and initiation of therapy with mirtazapine; at least 14 days should be allowed after discontinuing mirtazapine before starting an MAO inhibitor.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Although mirtazapine is not a tricyclic antidepressant, it does block norepinephrine reuptake within CNS synapses as part of its mechanisms. It has been suggested that vasoconstrictor be administered with caution and to monitor vital signs in dental patients taking antidepressants that affect norepinephrine in this way, including mirtazapine.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cytotec® may be confused with Cytoxan®, Sytobex®

Misoprostol may be confused with metoprolol, mifepristone

Pronunciation(mye soe PROST ole)

U.S. Brand NamesCytotec®

Canadian Brand NamesApo-Misoprostol®; Novo-Misoprostol

Pharmacologic CategoryProstaglandin

Use: Labeled IndicationsPrevention of NSAID-induced gastric ulcers; medical termination of pregnancy of ≤49 days (in conjunction with mifepristone)

Use: Unlabeled/InvestigationalCervical ripening and labor induction; NSAID-induced nephropathy; fat malabsorption in cystic fibrosis

Dosing: Adults

Prevention of NSAID-induced ulcers: Oral: 200 mcg 4 times/day with food; if not tolerated, may decrease dose to 100 mcg 4 times/day with food or 200 mcg twice daily with food. Last dose of the day should be taken at bedtime.

Labor induction or cervical ripening (unlabeled uses): Intravaginal: 25 mcg ($^1/_4$ of 100 mcg tablet); may repeat at intervals no more frequent than every 3-6 hours. Do not use in patients with previous cesarean delivery or prior major uterine surgery.

Medical termination of pregnancy: Oral: Refer to Mifepristone monograph.

Dosing: ElderlyOral: 100-200 mcg 4 times/day with food; if 200 mcg 4 times/day not tolerated, reduce to 100 mcg 4 times/day or 200 mcg twice daily with food. **Note:** To avoid the diarrhea potential, doses can be initiated at 100 mcg/day and increased 100 mcg/day at 3-day intervals until desired dose is achieved; also, recommend administering with food to decrease diarrhea incidence.

Dosing: Pediatric**Fat absorption in cystic fibrosis (unlabeled use):** Oral: Children 8-16 years: 100 mcg 4 times/day

Administration: OralIncidence of diarrhea may be lessened by having patient take dose right after meals. Therapy is usually begun on the second or third day of the next normal menstrual period.

Dietary ConsiderationsShould be taken with food; incidence of diarrhea may be lessened by having patient take dose right after meals.

StorageStore at or below 25°C (77°F).

ContraindicationsHypersensitivity to misoprostol, prostaglandins, or any component of the formulation; pregnancy (when used to reduce NSAID-induced ulcers)

Warnings/Precautions

Boxed warnings:

- Women of childbearing potential: See "Special populations" below.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Uterine perforation and/or rupture have been reported in association with intravaginal use to induce labor or with combined oral/intravaginal use to induce abortion. The manufacturer states that Cytotec® should not be used as a cervical-ripening agent for induction of labor. However, The American College of Obstetricians and Gynecologists (ACOG) continues to support this off-label use.
- Women of childbearing potential: **[U.S. Boxed Warning]: Not to be used in women of childbearing potential unless woman is capable of complying with effective contraceptive measures;** therapy is normally begun on the second or third day of next normal menstrual period.

Geriatric ConsiderationsElderly, due to extensive use of NSAIDs and the high percentage of asymptomatic hemorrhage and perforation from NSAIDs, are at risk for NSAID-induced ulcers and may be candidates for misoprostol use. However, routine use for prophylaxis is not justified. Patients must be selected upon demonstration that they are at risk for NSAID-induced lesions. Misoprostol should not be used as a first-line therapy for gastric or duodenal ulcers.

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: Not to be used in women of childbearing potential unless woman is capable of complying with effective contraceptive measures; therapy is normally begun on the second or third day of next normal menstrual period.** Misoprostol is an abortifacient. During pregnancy, use to prevent NSAID-induced ulcers is contraindicated. Reports of fetal death, congenital anomalies, uterine perforation, and abortion have been received after the use of misoprostol in pregnancy.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsIt is not known if misoprostol is excreted in human milk, however, because significant diarrhea may occur in a nursing infant, breast-feeding is contraindicated

Adverse Reactions

>10%: Gastrointestinal: Diarrhea, abdominal pain

1% to 10%:

Central nervous system: Headache

Gastrointestinal: Constipation, flatulence, nausea, dyspepsia, vomiting

<1%: Cramps, uterine stimulation, vaginal bleeding

Postmarketing and/or case reports: Abnormal taste, abnormal vision, alkaline phosphatase increased, alopecia, anaphylaxis, anemia, amylase increase, anxiety, appetite changes, arrhythmia, arterial thrombosis, arthralgia, back pain, breast pain, bronchospasm, cardiac enzymes increased, chest pain, confusion, deafness, depression, dermatitis, diaphoresis, drowsiness, dysphagia, dyspnea, earache, edema, epistaxis, ESR increased, fetal or infant death (when used during pregnancy), fever, GI bleeding, GI inflammation, gingivitis, glycosuria, gout, hyper-/hypotension, impotence, loss of libido, MI, muscle cramps, myalgia, neuropathy, neurosis, nitrogen increased, pallor, phlebitis, pulmonary embolism, purpura, rash, reflux, rigors, stiffness, syncope, thirst, thrombocytopenia, tinnitus, uterine rupture, weakness, weight changes

Drug Interactions

Oxytocin: Misoprostol may enhance the therapeutic effect of Oxytocin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Misoprostol peak serum concentrations may be decreased if taken with food (not clinically significant).

Nursing: Physical Assessment/MonitoringAssess knowledge/teach appropriate antiulcer diet and lifestyle. Monitor renal function and fluid balance. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment and do not give to women of childbearing age or to males who may have intercourse with women of childbearing age unless both male and female are capable of complying with contraceptive measures during therapy and for 1 month following therapy.

Patient EducationTake as directed; continue taking your NSAIDs while taking this medication. Take with meals or after meals to prevent nausea, diarrhea, and flatulence. Avoid using antacids. You may experience increased menstrual pain, or cramping; request analgesics. Report abnormal menstrual periods, spotting (may occur even in postmenstrual women), or severe menstrual bleeding. **Pregnancy/breast-feeding precautions:** When used to prevent NSAID-induced ulcers: Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Do not get pregnant during or for 1 month following therapy. Male: Do not cause a female to become pregnant. Male/female: Consult prescriber for instruction on appropriate contraceptive measures if necessary or if you suspect you might be pregnant. This drug may cause severe fetal defects, miscarriage, or abortion; do not share medication with others. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 100 mcg, 200 mcg

Generic AvailableYes

ManufacturerSearle

Pricing: U.S. (www.drugstore.com)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

> Mitomycin may be confused with mithramycin, mitotane, mitoxantrone

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(mye toe MYE sin)

Canadian Brand NamesMutamycin®

Pharmacologic CategoryAntineoplastic Agent, Antibiotic

Use: Labeled IndicationsTreatment of adenocarcinoma of stomach or pancreas, bladder cancer, breast cancer, or colorectal cancer

Use: Unlabeled/InvestigationalPrevention of excess scarring in glaucoma filtration procedures in patients at high risk of bleb failure

Dosing: AdultsRefer to individual protocols:

Single-agent therapy: I.V.: 20 mg/m^2 every 6-8 weeks

Combination therapy: I.V.: 10 mg/m^2 every 6-8 weeks

Bladder carcinoma: Intravesicular instillations (unapproved route): 20-40 mg instilled into the bladder and retained for 3 hours up to 3 times/week for up to 20 procedures per course.

Glaucoma surgery (unlabeled use): 0.2-0.5 mg (0.2-0.5 mg/mL solution)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricUnlabeled use. Refer to adult dosing.

Dosing: Renal ImpairmentThe FDA-approved labeling states to avoid use in patients with serum creatine >1.7 mg/dL, but offers no other dosage adjustment guidelines. The following guidelines have been used by some clinicians (Aronoff, 2007): Adults:

Cl_{cr} <10 mL/minute: Administer 75% of dose

Continuous ambulatory peritoneal dialysis (CAPD): Administer 75% of dose

Dosing: Hepatic ImpairmentAlthough some mitomycin may be excreted in the bile, no specific guidelines regarding dosage adjustment in hepatic impairment are available.

Dosing: Combination Regimens

Breast cancer: VM

Gastric cancer: FAM

Pancreatic cancer: FAM

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Vesicant. Administer slow I.V. push or by slow (15-30 minute) infusion via a freely-running dextrose or saline infusion. Consider using a central venous catheter.

Administration: I.V. DetailpH: 6-8

Administration: Other

Intravesicular (unlabeled route): Instill into bladder for up to 3 hours (rotate patient every 15-30 minutes)

Glaucoma surgery (unlabeled route): Apply to pledget and place in contact with surgical wound for 2-5 minutes (doses and techniques may vary)

StorageStore intact vials at controlled room temperature. Mitomycin solution is stable for 7 days at room temperature and 14 days when refrigerated if protected from light. Solution of 0.5 mg/mL in a syringe is stable for 7 days at room temperature and 14 days when refrigerated and protected from light.

Further dilution to 20-40 mcg/mL:

In normal saline: Stable for 12 hours at room temperature.

In sodium lactate: Stable for 24 hours at room temperature.

ReconstitutionDilute powder with SWFI or 0.9% sodium chloride to a concentration of 0.5-1 mg/mL.
CompatibilityStable in LR; **variable stability (consult detailed reference)** in D_5W, NS.

Y-site administration: Compatible: Amifostine, bleomycin, cisplatin, cyclophosphamide, doxorubicin, droperidol, fluorouracil, furosemide, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, ondansetron, teniposide, thiotepa, vinblastine, vincristine. **Incompatible:** Aztreonam, cefepime, etoposide phosphate, filgrastim, gemcitabine, piperacillin/tazobactam, sargramostim, topotecan, vinorelbine.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin, methotrexate, metoclopramide, vinblastine, vincristine.

Compatibility when admixed: Compatible: Dexamethasone sodium phosphate, hydrocortisone sodium succinate. **Incompatible:** Bleomycin. **Variable (consult detailed reference):** Heparin.

ContraindicationsHypersensitivity to mitomycin or any component of the formulation; thrombocytopenia; coagulation disorders, increased bleeding tendency; pregnancy
Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hemolytic-uremic syndrome: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bladder fibrosis/contraction: With intravesical administration, bladder fibrosis/contraction has been reported.
- Bone marrow suppression: **[U.S. Boxed Warning]: May cause bone marrow suppression (thrombocytopenia and leukopenia);** monitor for infections.
- Hemolytic-uremic syndrome: **[U.S. Boxed Warning]: Hemolytic-uremic syndrome, potentially fatal, has been reported;** is correlated with total dose (single doses ≥60 mg or cumulative doses ≥50 mg/m^2) and total duration of therapy (>5-11 months).
- Potent vesicant: **Mitomycin is a potent vesicant, may cause ulceration, necrosis, cellulitis, and tissue sloughing if infiltrated.**

Disease-related concerns:

- Renal impairment: Do not administer if serum creatinine is >1.7 mg/dL; monitor for renal toxicity.

Concurrent drug therapy issues:

- Vinca alkaloids: Shortness of breath and bronchospasm have been reported in patients receiving vinca alkaloids in combination with or after mitomycin; may be managed with bronchodilators, steroids and/or oxygen.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Radiation therapy recipients: Use with caution in patients who have received radiation therapy or in the presence of hepatobiliary dysfunction; reduce dosage in patients who are receiving radiation therapy simultaneously.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD
Pregnancy ConsiderationsMitomycin can cause fetal harm in humans. Animal studies show delayed fetal development, fetal external anomalies, and neonatal anomalies.
LactationEnters breast milk/contraindicated
Adverse Reactions

>10%:

Cardiovascular: CHF (3% to 15%) (doses >30 mg/m^2)

Central nervous system: Fever (14%)

Dermatologic: Alopecia, nail banding/discoloration

Gastrointestinal: Nausea, vomiting and anorexia (14%)

Hematologic: Anemia (19% to 24%); myelosuppression, common, dose limiting, delayed

Onset: 3 weeks

Nadir: 4-6 weeks

Recovery: 6-8 weeks

1% to 10%:

Dermatologic: Rash

Gastrointestinal: Stomatitis

Neuromuscular: Paresthesia

Renal: Creatinine increased (2%)

Respiratory: Interstitial pneumonitis, infiltrates, dyspnea, cough (7%)

<1%: Malaise, pruritus, extravasation reactions, hemolytic uremic syndrome, renal failure, bladder fibrosis/contraction (intravesical administration)

Oncology: VesicantYes; see Management of Drug Extravasations.

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Antineoplastic Agents (Vinca Alkaloids): May enhance the adverse/toxic effect of Mitomycin. Specifically, the risk of pulmonary toxicity may be increased. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersPlatelet count, CBC with differential, hemoglobin, prothrombin time, renal and pulmonary function tests

Nursing: Physical Assessment/MonitoringUse with caution in presence of hepatobiliary dysfunction or radiation therapy (past or present). Assess potential for interactions with other pharmacological and herbal products patient may be taking. See Administration for infusion specifics; infusion site must be closely monitored to prevent extravasation. Mitomycin is a potent vesicant; may cause ulceration, necrosis, cellulitis, and tissue sloughing if infiltrated. Evaluate results of laboratory tests, therapeutic response, and adverse reactions (eg, signs of CHF, hydration and nutritional status, and opportunistic infection) on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPlatelet count, CBC with differential, prothrombin time, renal and pulmonary function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug is administered intravenously; report immediately any redness, swelling, burning, or pain at infusion site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). May cause nausea, vomiting, or anorexia (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); mouth sores (use soft toothbrush, waxed dental floss, and frequent mouth rinses); or loss of hair or discoloration of nails (may be reversible when therapy is discontinued). Report rash or itching, unresolved nausea or diarrhea; respiratory difficulty, swelling of extremities, sudden weight gain, or unusual cough; any numbness, tingling, or loss of sensation; or opportunistic infection (fever, chills, sore throat, burning urination, fatigue). **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 5 mg, 20 mg, 40 mg

Generic AvailableYes

Mechanism of ActionActs like an alkylating agent and produces DNA cross-linking (primarily with guanine and cytosine pairs); cell-cycle nonspecific; inhibits DNA and RNA synthesis; degrades preformed DNA, causes nuclear lysis and formation of giant cells. While not phase-specific *per se*, mitomycin has its maximum effect against cells in late G and early S phases.

Pharmacodynamics/Kinetics

Distribution: V_d: 22 L/m^2; high drug concentrations found in kidney, tongue, muscle, heart, and lung tissue; probably not distributed into the CNS

Metabolism: Hepatic

Half-life elimination: 23-78 minutes; Terminal: 50 minutes

Excretion: Urine (<10% as unchanged drug), with elevated serum concentrations

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Mitotane may be confused with mitomycin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(MYE toe tane)

U.S. Brand NamesLysodren®

Canadian Brand NamesLysodren®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled IndicationsTreatment of adrenocortical carcinoma

Use: Unlabeled/InvestigationalTreatment of Cushing's syndrome

Dosing: Adults**Adrenocortical carcinoma:** Oral: Start at 2-6 g/day in 3-4 divided doses, then increase incrementally to 9-10 g/day in 3-4 divided doses (maximum daily dose: 18 g)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Adrenocortical carcinoma (unlabeled use):** Oral: 1-2 g/day in divided doses, increasing gradually to a maximum of 5-7 g/day

Dosing: Hepatic ImpairmentDose may need to be decreased in patients with liver disease.

StorageStore at room temperature.

ContraindicationsHypersensitivity to mitotane or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Adrenal insufficiency: See "Concerns related to adverse effects" below.
- Experienced physician: See "Other warnings/precautions" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Adrenal insufficiency: **[U.S. Boxed Warning]: Acute adrenal insufficiency may occur in the face of shock, trauma, or infection.** Mitotane should be discontinued temporarily in this setting and appropriate steroid coverage should be administered.
- Neurotoxicity: Observe patients for neurotoxicity with long-term (>2 years) use.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; metabolism may be decreased.
- Metastatic masses: Surgically remove tumor tissues from metastatic masses prior to initiation of treatment; rapid cytotoxic effect may cause tumor hemorrhage.

Concurrent drug therapy issues:

- Corticosteroid replacement therapy: Steroid replacement with glucocorticoid, and sometimes mineralocorticoid, is necessary. It has been recommended that replacement therapy be initiated at the start of therapy, rather than waiting for evidence of adrenal insufficiency. Because mitotane can increase the metabolism of hydrocortisone, higher than usual replacement doses of the latter may be required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning] Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: CNS depression (32%), somnolence (25%), dizziness/vertigo (15%)

Dermatologic: Skin rash (15%)

Gastrointestinal: Anorexia (24%), nausea (39%), vomiting (37%), diarrhea (13%)

Neuromuscular & skeletal: Weakness (12%)

1% to 10%:

Central nervous system: Headache (5%), confusion (3%)

Neuromuscular & skeletal: Muscle tremor (3%)

<1% and/or frequency not defined: Albuminuria, blurred vision, diplopia, flushing, hematuria, hemorrhagic cystitis, hypertension, hyperpyrexia, lens opacity, myalgia, orthostatic hypotension, protein bound iodine decreased, toxic retinopathy

Oncology: Emetic PotentialModerate (30% to 60%)

Drug Interactions

Potassium-Sparing Diuretics: May diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersAdrenal function; neurologic assessments with chronic (>2 years) use

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological and herbal products patient may be taking. Evaluate therapeutic response and adverse reactions on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationTake as directed; do not alter dose or discontinue without consulting prescriber. Desired effects of this drug may not be seen for 2-3 months. Wear identification that alerts medical personnel that you are taking this drug in event of shock or trauma. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition. Avoid alcohol. May cause dizziness, headache, confusion (avoid driving or performing tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report severe vomiting or diarrhea; rash; or muscular twitching, tremor, numbness, or weakness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [scored]:

Lysodren®: 500 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Lysodren)

500 mg (30): $154.06

Mechanism of ActionCauses adrenal cortical atrophy; drug affects mitochondria in adrenal cortical cells and decreases production of cortisol; also alters the peripheral metabolism of steroids

Pharmacodynamics/Kinetics

Absorption: Oral: ~35% to 40%

Distribution: Stored mainly in fat tissue but is found in all body tissues

Metabolism: Hepatic and other tissues

Half-life elimination: 18-159 days

Time to peak, serum: 3-5 hours

Excretion: Urine (10% as metabolites) and feces (1% to 17% as metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and depression are common; may cause sedation, irritability, or confusion

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Mitoxantrone Cardiac Monitoring Recommendations - July 30, 2008

The U.S. Food and Drug Administration (FDA) issued an alert re-enforcing the need for left ventricular ejection fraction (LVEF) evaluation with mitoxantrone (Novantrone®) use. In 2005, the product labeling was updated, recommending LVEF evaluation before treatment initiation and prior to each dose in patients with multiple sclerosis (MS). This was in response to postmarketing reports of decreases in LVEF and heart failure in patients who had received cumulative doses of <100 mg/m^2. The FDA has received further information from a postmarketing safety study demonstrating a lack of adherence to these recommendations. In addition to reminding healthcare providers to follow cardiac monitoring recommendations, the FDA is now advising that all MS patients who have completed treatment with mitoxantrone should receive an annual LVEF evaluation to monitor for delayed cardiotoxicity.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Mitoxantrone

Medication Safety Issues

Sound-alike/look-alike issues:

Mitoxantrone may be confused with methotrexate, mitomycin, Mutamycin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(mye toe ZAN trone)

U.S. Brand NamesNovantrone®

Canadian Brand NamesMitoxantrone Injection®; Novantrone®

Pharmacologic CategoryAntineoplastic Agent, Anthracenedione

Use: Labeled IndicationsTreatment of acute nonlymphocytic leukemias, prostate cancer, lymphoma, secondary progressive or relapsing-remitting multiple sclerosis (MS)

Use: Unlabeled/InvestigationalTreatment of pediatric acute leukemias, pediatric sarcoma

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted. I.V. (may dilute in D_5W or NS):

Acute leukemias: I.V.:

Induction: 12 mg/m^2 once daily for 3 days; for incomplete response, may repeat at 12 mg/m^2 once daily for 2 days

Consolidation: 12 mg/m^2 once daily for 2 days, repeat in 4 weeks

Solid tumors: I.V.: 12-14 mg/m^2 every 3-4 weeks **or** 2-4 mg/m^2/day for 5 days

Hormone-refractory prostate cancer: I.V.: 12-14 mg/m^2 every 3 weeks

Multiple sclerosis: I.V.: 12 mg/m^2 every 3 months (maximum lifetime cumulative dose: 140 mg/m^2; discontinue use with LVEF <50% or clinically significant reduction in LVEF)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDetails concerning dosing in combination regimens should also be consulted.

Acute leukemias (unlabeled use): I.V. (may dilute in D_5W or NS):

Children ≤2 years: 0.4 mg/kg/day once daily for 3-5 days

Children >2 years: Refer to adult dosing.

Solid tumors (unlabeled use): I.V.: Children: 18-20 mg/m^2 every 3-4 weeks **or** 5-8 mg/m^2 every week

Dosing: Renal ImpairmentSafety and efficacy have not been established.

Hemodialysis: Supplemental dose is not necessary

Peritoneal dialysis: Supplemental dose is not necessary

Elderly: Clearance is decreased in elderly patients; use with caution

Dosing: Hepatic ImpairmentOfficial dosage adjustment recommendations have not been established. Clearance is reduced in hepatic dysfunction; patients with severe hepatic dysfunction (bilirubin >3.4 mg/dL) have an AUC of 3 times greater than patients with normal hepatic function. Consider dose adjustments. **Note:** MS patients with hepatic impairment should not receive mitoxantrone.

Dosing: Combination Regimens

Breast cancer:

MINE

MINE-ESHAP

Prostate cancer:

Mitoxantrone + Hydrocortisone

MP (Prostate Cancer)

Oncology: Bone Marrow - High DoseI.V.: 24-48 mg/m^2 as a single dose; duration of infusion is 1-4 hours; total doses of 75-90 mg/m^2 have been used. Generally combined with other high-dose chemotherapeutic drugs.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Irritant. Administered as a short (5-30 minutes) I.V. infusion; continuous 24-hour infusions are occasionally used. Although not generally recommended, mitoxantrone has been given as a rapid bolus over 1-3 minutes. High doses for bone marrow transplant are usually given as 1- to 4-hour infusions.

Administration: I.V. DetailAvoid extravasation - although has not generally been proven to be a vesicant.

StorageStore intact vials at 15°C to 25°C (59°F to 77°F); do not freeze. Opened vials may be stored at room temperature for 7 days or under refrigeration for up to 14 days. Solutions diluted for administration are stable for 7 days at room temperature or under refrigeration.

ReconstitutionDilute in at least 50 mL of NS or D$_5$W.

CompatibilityStable in D$_5$NS, D$_5$W, NS.

Y-site administration: Compatible: Allopurinol, amifostine, cladribine, etoposide phosphate, filgrastim, fludarabine, gatifloxacin, gemcitabine, granisetron, linezolid, melphalan, ondansetron, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, aztreonam, cefepime, doxorubicin liposome, paclitaxel, piperacillin/tazobactam, propofol.

Compatibility when admixed: Compatible: Cyclophosphamide, cytarabine, fluorouracil, hydrocortisone sodium succinate, potassium chloride. **Incompatible:** Heparin. **Variable (consult detailed reference):** Hydrocortisone sodium phosphate.

ContraindicationsHypersensitivity to mitoxantrone or any component of the formulation; multiple sclerosis with left ventricular ejection fraction (LVEF) <50% or clinically significant decrease in LVEF

Warnings/Precautions

Boxed warnings:

- Appropriate administration: See “Other warnings/precautions” below.

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Myocardial toxicity: See “Concerns related to adverse effects” below.
- Secondary malignancy: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Treatment may lead to severe myelosuppression; use with caution in patients with pre-existing myelosuppression. **[U.S. Boxed Warning]: Do not use if baseline neutrophil count <1500 cells/mm^3 (except for in the treatment of ANLL).**
- Myocardial toxicity: **[U.S. Boxed Warning]: May cause myocardial toxicity and potentially-fatal heart failure; risk increases with cumulative dosing.** Effects may be delayed. Predisposing factors for mitoxantrone-induced cardiotoxicity include prior anthracycline therapy, prior cardiovascular disease, concomitant use of cardiotoxic drugs, and mediastinal/pericardial irradiation. Not recommended for use when left ventricular ejection fraction (LVEF) <50%, or baseline LVEF below the lower limit of normal (LLN) for MS patients. Use in MS should be limited to a cumulative dose of ≤140 mg/m^2, and discontinued if LVEF falls below LLN or a significant decrease in LVEF is observed; decreases in LVEF and heart failure have been observed in patients with MS who have received cumulative doses <100 mg/m^2. Patients with MS should undergo annual LVEF evaluation following discontinuation of therapy to monitor for delayed cardiotoxicity.
- Secondary malignancy: **[U.S. Boxed Warning]: Has been associated with the development of secondary acute myelogenous leukemia and myelodysplasia;** risk is increased in patients who are heavily pretreated, with higher doses, and with combination chemotherapy.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended. Not for treatment of multiple sclerosis in patients with concurrent hepatic impairment.
- Multiple sclerosis: Not for treatment of primary progressive multiple sclerosis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate administration: **[U.S. Boxed Warning]: For I.V. administration only; may cause severe local tissue damage if extravasation occurs. Do not administer intrathecally; may cause serious and permanent neurologic damage.**
- Blue-green coloration: May cause urine, saliva, tears, and sweat to turn blue-green for 24 hours postinfusion; whites of eyes may have blue-green tinge.
- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsAdverse effects were noted in animal studies. May cause fetal harm if administered to a pregnant woman. There are no adequate and well-controlled studies in pregnant women. Pregnancy should be avoided while on treatment. Women with multiple sclerosis and who are biologically capable of becoming pregnant should have a pregnancy test prior to each dose.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsMitoxantrone is excreted in human milk and significant concentrations (180 mg/mL) have been reported for 28 days after the last administration. Because of the potential for serious adverse reactions in infants from mitoxantrone, breast-feeding should be discontinued before starting treatment.

Adverse ReactionsIncludes events reported with any indication; incidence varies based on treatment/dose

>10%:

Cardiovascular: Arrhythmia (3% to 18%), edema (10% to 31%), ECG changes (11%)

Central nervous system: Pain (8% to 41%), fatigue (up to 39%), fever (6% to 78%), headache (6% to 13%)

Dermatologic: Alopecia (20% to 61%), nail bed changes (11%)

Endocrine & metabolic: Amenorrhea (28% to 53%), menstrual disorder (26% to 61%), hyperglycemia (10% to 31%)

Gastrointestinal: Abdominal pain (9% to 15%), anorexia (22% to 25%), nausea (26% to 76%), constipation (10% to 16%), diarrhea (14% to 47%), GI bleeding (2% to 16%), mucositis (10% to 29%), stomatitis (8% to 29%), dyspepsia (5% to 14%), vomiting (6% to 11%), weight gain/loss (13% to 17%)

Genitourinary: Abnormal urine (6% to 11%), urinary tract infection (7% to 32%)

Hematologic: Neutropenia (79% to 100%), leukopenia (9% to 100%), lymphopenia (72% to 95%), anemia (5% to 75%), hemoglobin decreased (43%), thrombocytopenia (33% to 39%), petechiae/bruising (6% to 11%); myelosuppression (WBC: mild; platelets: mild; onset: 7-10 days; nadir: 14 days; recovery: 21 days)

Hepatic: Alkaline phosphatase increased (37%), transaminases increased (5% to 20%), GGT increased (3% to 15%)

Neuromuscular & skeletal: Weakness (24%)

Renal: BUN increased (22%), creatinine increased (13%), hematuria (11%)

Respiratory: Cough (5% to 13%), dyspnea (6% to 18%), upper respiratory tract infection (7% to 53%)

Miscellaneous: Fungal infection (9% to 15%), infection (4% to 18%), sepsis (ANLL 31% to 34%)

1% to 10%:

Cardiovascular: Ischemia (5%), LVEF decreased (≤5%), hypertension (4%), CHF (2% to 5%)

Central nervous system: Chills (5%), anxiety (5%), depression (5%), seizure (2% to 4%)

Dermatologic: Skin infection

Endocrine & metabolic: Hypocalcemia (10%), hypokalemia (7% to 10%), hyponatremia (9%), menorrhagia (7%)

Gastrointestinal: Aphthosis (10%)

Genitourinary: Impotence (7%), sterility (5%)

Hematologic: Granulocytopenia (6%), hemorrhage (6%)

Hepatic: Jaundice (3% to 7%)

Neuromuscular & skeletal: Back pain (8%), myalgia (5%), arthralgia (5%)

Ocular: Conjunctivitis (5%), blurred vision (3%)

Renal: Renal failure (8%), proteinuria (6%)

Respiratory: Rhinitis (10%), pneumonia (9%), sinusitis (6%)

Miscellaneous: Systemic infection, diaphoresis (9%), development of secondary leukemia (~1% to 2%)

<1% or frequency not defined: Acute leukemia, allergic reaction, anaphylactoid reactions, anaphylaxis, chest pain, extravasation and phlebitis at the infusion site, interstitial pneumonitis (has occurred during combination chemotherapy), irritant chemotherapy with blue skin discoloration, rash, tachycardia

Oncology: VesicantNo; may be an irritant
Oncology: Emetic PotentialLow (10% to 30%)
Oncology: Bone Marrow - Unique Toxicity

Cardiovascular: Bradycardia (infusion-related), heart failure

Dermatologic: Alopecia

Gastrointestinal: Severe mucositis, skin discoloration

Metabolism/Transport Effects**Inhibits** CYP3A4 (weak)
Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid echinacea (may diminish the immunosuppressant effect).
Monitoring ParametersCBC, serum uric acid (for treatment of leukemia), liver function tests; signs and symptoms of cardiac disease; evaluate ECG and LVEF prior to start of therapy and regularly during treatment, especially with the development of signs and symptoms of heart failure. In addition, for the treatment of multiple sclerosis, obtain pregnancy test and monitor LVEF prior to each dose and annually after completion of therapy (to monitor for delayed cardiotoxicity).
Nursing: Physical Assessment/MonitoringShould only be administered under the supervision of an experienced cancer chemotherapy physician. Assess patient carefully for cautious use indications and contraindications. Note Administration for infusion specifics. Infusion site must be monitored closely to prevent extravasation. Evaluate results of laboratory tests prior to start of therapy and regularly during treatment. Evaluate evidence of therapeutic effectiveness and adverse response (eg, arrhythmia, hypersensitivity reactions, myelosuppression [anemia], gastrointestinal upset [nutritional and hydration status], opportunistic infection, gout, CHF [rales, dyspnea, edema]) with each dose and throughout therapy. Teach patient possible side effects/appropriate interventions (eg, avoid crowds, maintain hydrations) and adverse symptoms to report (eg, symptoms of cardiotoxicity).
Monitoring: Lab TestsCBC, serum uric acid, liver function, echocardiogram; LVEF prior to start of therapy and regularly during treatment, especially with the development of signs and symptoms of heart failure. In addition, in the treatment of multiple sclerosis, obtain pregnancy test prior to all doses and LVEF prior to each dose and annually after completion of therapy (to monitor for delayed cardiotoxicity)
Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This drug is only administered by infusion; report immediately any redness, swelling, burning, or pain at infusion site. Maintain

adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause urine, saliva, tears, sweat, and whites of eyes to turn blue-green for 24 hours postinfusion (this is normal); nausea, vomiting, or GI upset (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); mouth sores (use soft toothbrush or cotton swabs, waxed dental floss, and frequent mouth rinses); headache, dizziness, or blurred vision (use caution when driving or engaging in tasks that are potentially hazardous until response to drug is known); or loss of hair (may be reversible). Report chest pain or palpitations; rapid or erratic heartbeat; difficulty breathing or constant cough; swelling of extremities or sudden weight gain; persistent fever or chills; or opportunistic infection (eg, fever, chills, sore throat, burning urination, fatigue); changed or decreased urine output. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution [concentrate; preservative free]: 2 mg/mL (10 mL, 12.5 mL, 15 mL, 20 mL)

Novantrone®: 2 mg/mL (10 mL, 15 mL [DSC])

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Concentrate (Novantrone)

2 mg/mL (10): $1340.73

Mechanism of ActionAnalogue of the anthracyclines, mitoxantrone intercalates DNA; binds to nucleic acids and inhibits DNA and RNA synthesis by template disordering and steric obstruction; replication is decreased by binding to DNA topoisomerase II and seems to inhibit the incorporation of uridine into RNA and thymidine into DNA; active throughout entire cell cycle

Pharmacodynamics/Kinetics

Absorption: Oral: Poor

Distribution: V_d: 14 L/kg; distributes into pleural fluid, kidney, thyroid, liver, heart, and red blood cells

Protein binding: >95%, 76% to albumin

Metabolism: Hepatic; pathway not determined

Half-life elimination: Terminal: 23-215 hours; may be prolonged with hepatic impairment

Excretion: Urine (6% to 11%; 65% as unchanged drug); feces (25%; 65% as unchanged drug)

Moclobemide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(moe KLOE be mide)

Canadian Brand NamesApo-Moclobemide®; Dom-Moclobemide; Manerix®; Novo-Moclobemide; Nu-Moclobemide; PMS-Moclobemide

Pharmacologic Category[Antidepressant, Monoamine Oxidase Inhibitor, Reversible]

Use: Labeled IndicationsSymptomatic relief of depressive illness

Dosing: Adults**Depressive illness:** Oral: Initial: 300 mg/day in 2 divided doses; increase gradually to maximum of 600 mg/day. **Note:** Individual patient response may allow a reduction in daily dose in long-term therapy.

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentDecrease daily dose by $^{1}/_{3}$ to $^{1}/_{2}$

Administration: OralAdminister immediately after meals.

Dietary ConsiderationsShould be taken immediately after meals. Manufacturer states no special dietary restrictions are required; may be taken with tyramine-containing foods. However, patients should be instructed to recognize occipital headache, palpitations, neck stiffness, or other signs of a severe reaction.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to moclobemide or any component of the formulation; uncontrolled hypertension; hepatic disease; confusional states; concurrent use of sympathomimetics (and related compounds), MAO inhibitors, meperidine, tricyclic antidepressants, serotonergic drugs (including SSRIs) - do not use within 5 weeks of fluoxetine discontinuation or 2 weeks of other antidepressant discontinuation; general anesthesia, local vasoconstrictors; spinal anesthesia (hypotension may be exaggerated). Not approved for use in patients <18 years of age.

Warnings/Precautions

Concerns related to adverse effects:

- Suicidal thinking/behavior: The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Use caution in high-risk patients during initiation of therapy. Prescriptions should be written for the smallest quantity consistent with good patient care.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dose adjustment required.
- Pheochromocytoma: Use with caution in patients with pheochromocytoma.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid dysfunction: Use with caution in patients with thyrotoxicosis.

Concurrent drug therapy issues:

- Anesthesia: Discontinue 2 days prior to local or general anesthesia.
- Buspirone: Use with caution in patients receiving concurrent buspirone.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.
- Serotonergic agents: Severe reactions may occur if MAO inhibitors and serotonergic agents, including SSRIs are used concurrently.

Other warnings/precautions:

- Tyramine restriction: Dietary restriction of tyramine does not appear to be necessary for patients receiving moclobemide (patients must be informed of signs/symptoms of reaction).

Pregnancy Risk FactorNot available

Pregnancy ConsiderationsSafety has not been established, use only if benefits outweigh the risks.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsLess than 1% of maternal dose is excreted in breast milk; benefits should outweigh risks.

Adverse Reactions

1% to 10%:

Cardiovascular: Tachycardia (4%), hypotension (3%)

Central nervous system: Headache (8%), dizziness (7%), sleep disturbance (7%), agitation (5%), nervousness (5%), sedation (4%), somnolence (4%), anxiety (3%)

Endocrine & metabolic: Appetite increased (1%)

Gastrointestinal: Xerostomia (9%), nausea (5%), constipation (4%), abdominal pain (2%), diarrhea (2%), vomiting (2%)

Neuromuscular & skeletal: Weakness (1%)

Ocular: Blurred vision (2%)

Miscellaneous: Diaphoresis increased (2%)

<1%: Aggression, allergic reaction, angina, apathy, bradycardia, confusion, conjunctivitis, delusions, disorientation, dysarthria, dyspnea, dysuria, extrapyramidal effects, flushing, gastritis, gingivitis, hallucinations, hypertension, insomnia, irritability, mania, metrorrhagia, migraine, muscular pain, nightmares, paresthesia, photopsia, polyuria, prolonged menstruation, pruritus, rash, skeletal pain, stomatitis, taste alteration, tenesmus, tinnitus, transaminases increased, urticaria, visual disturbances

Metabolism/Transport Effects **Substrate** (major) of CYP2C19, 2D6; **Inhibits** CYP1A2 (weak), 2C19 (weak), 2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

Cimetidine: May decrease the metabolism of Moclobemide. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Dietary restriction of tyramine does not appear to be necessary.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, ginseng. Avoid ginkgo (may lead to MAO inhibitor toxicity). Avoid ephedra, yohimbe (can cause hypertension). Avoid kava (may increase CNS depression).

Monitoring ParametersBlood pressure, warning signs of suicide

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet: 150 mg, 300 mg

Alti-Moclobemide [CAN], Apo-Moclobemide® [CAN], Dom-Moclobemide® [CAN], Manerix®e [CAN], Novo-Moclobemidee [CAN], Nu-Moclobemidee [CAN], PMS-Moclobemide [CAN]: 150 mg, 300 mg [not available in the U.S.]

Generic AvailableYes

ManufacturerHoffman-La Roche Ltd (Canada)

Mechanism of ActionMoclobemide is a benzamide derivative which acts as a short-acting reversible inhibitor of monoamine oxidase (MAO), which inhibits the metabolism (deamination) of serotonin, norepinephrine, and dopamine. It has a relative specificity for the A subtype of monoamine oxidase (MAO type A). Its action leads to increased concentrations of these neurotransmitters, which may account for the antidepressant activity of moclobemide.

Pharmacodynamics/Kinetics

Absorption: 98% from GI tract

Distribution: 1.2 L/kg

Protein binding: ~50% to albumin

Metabolism: Oxidative reactions

Half-life elimination: Terminal: 1-2 hours

Excretion: Urine (95%, as metabolites)

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children’s Healthcare Quality.

Pronunciation(moe DAF i nil)
U.S. Brand NamesProvigil®
Canadian Brand NamesAlertec®; APO-Modafinil
Pharmacologic CategoryStimulant
Use: Labeled IndicationsImprove wakefulness in patients with excessive daytime sleepiness associated with narcolepsy and shift work sleep disorder (SWSD); adjunctive therapy for obstructive sleep apnea/hypopnea syndrome (OSAHS)
Use: Unlabeled/InvestigationalAttention-deficit/hyperactivity disorder (ADHD); treatment of fatigue in MS and other disorders
Dosing: Adults

ADHD (unlabeled use): Oral: 100-300 mg once daily

Narcolepsy, obstructive sleep apnea/hypopnea syndrome (OSAHS): Oral: Initial: 200 mg as a single daily dose in the morning.

Shift work sleep disorder (SWSD): Oral: Initial: 200 mg as a single dose taken ~1 hour prior to start of work shift.

Note: Doses of 400 mg/day, given as a single dose, have been well tolerated, but there is no consistent evidence that this dose confers additional benefit.

Dosing: ElderlyElimination of modafinil and its metabolites may be reduced as a consequence of aging and as a result, consider initiating dose at 100 mg once daily.
Dosing: Pediatric

ADHD (unlabeled use): Oral: 50-100 mg once daily

Dosing: Renal ImpairmentSafety and efficacy have not been established in severe renal impairment.
Dosing: Hepatic ImpairmentDose should be reduced to one-half of that recommended for patients with normal liver function.
RestrictionsC-IV
ContraindicationsHypersensitivity to modafinil, armodafinil, or any component of the formulation
Allergy Considerations

- Modafinil Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May impair the ability to engage in potentially hazardous activities. The degree of sleepiness should be reassessed frequently; some patients may not return to a normal level of wakefulness.

- Dermatologic effects (severe): Serious and life-threatening rashes, including Stevens-Johnson syndrome and toxic epidermal necrolysis, have been reported with modafinil. Although initially reported in children during clinical trials, postmarketing cases have occurred in both children and adults. Most cases have occurred within the first 5 weeks of therapy; however, rare cases have occurred after long-term use. No risk factors have been identified to predict occurrence or severity. Patients should be advised to discontinue at first sign of rash.

- Hypersensitivity reactions: Rare cases of multiorgan hypersensitivity reactions in association with modafinil use and lone cases of angioedema and anaphylactoid reactions with armodafinil have been reported. Signs and symptoms are diverse, reflecting the involvement of specific organs. Patients typically present with fever and rash associated with organ-system dysfunction. Patients should be advised to report any signs and symptoms related to these effects; discontinuation of therapy is recommended.

Disease-related concerns:

- Cardiovascular disease: Use is not recommended in patients with a history of angina, cardiac ischemia, recent history of myocardial infarction, left ventricular hypertrophy, or patients with mitral valve prolapse who have developed mitral valve prolapse syndrome with previous CNS stimulant use. Increase monitoring in patients with hypertension; additional therapy may be necessary.

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage reduction is recommended.

- Psychiatric disorders: Use with caution in patients with pre-existing psychosis or bipolar disorder (may induce mixed/manic episode). May exacerbate symptoms of behavior and thought disorder in psychotic patients; new onset psychosis or mania may occur with stimulant use; observe for symptoms of aggression, hostility, or suicidal ideation.

- Renal impairment: Use with caution in patients with renal impairment.

- Sleep disorders: Appropriate use: For use following complete evaluation of sleepiness and in conjunction with other standard treatments (eg, CPAP). The degree of sleepiness should be reassessed frequently; some patients may not return to a normal level of wakefulness.

- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age (U.S. labeling) or <18 years of age (Canadian labeling).

Geriatric ConsiderationsClearance of modafinil may be reduced in the elderly. Safety and effectiveness in persons >65 years of age have not been established. In the limited number of elderly patients studied, the incidence of adverse events was similar to younger patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEmbryotoxic effects have been observed in some, but not all animal studies. There are no adequate and well-controlled studies in pregnant women; use only when the potential risk of drug therapy is outweighed by the drug's benefits. Efficacy of steroidal contraceptives may be decreased; alternate means of contraception should be considered during therapy and for 1 month after modafinil is discontinued.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (34%, dose related)

Gastrointestinal: Nausea (11%)

1% to 10%:

Cardiovascular: Chest pain (3%), hypertension (3%), palpitation (2%), tachycardia (2%), vasodilation (2%), edema (1%)

Central nervous system: Nervousness (7%), dizziness (5%), depression (2%), anxiety (5%; dose related), insomnia (5%), somnolence (2%), chills (1%), agitation (1%), confusion (1%), emotional lability (1%), vertigo (1%)

Dermatologic: Rash (1%; includes some severe cases requiring hospitalization)

Gastrointestinal: Diarrhea (6%), dyspepsia (5%), xerostomia (4%), anorexia (4%), constipation (2%), flatulence (1%), mouth ulceration (1%), taste perversion (1%)

Genitourinary: Abnormal urine (1%), hematuria (1%), pyuria (1%)

Hematologic: Eosinophilia (1%)

Hepatic: LFTs abnormal (2%)

Neuromuscular & skeletal: Back pain (6%), paresthesia (2%), dyskinesia (1%), hyperkinesia (1%), hypertonia (1%), neck rigidity (1%), tremor (1%)

Ocular: Amblyopia (1%), eye pain (1%), vision abnormal (1%)

Respiratory: Pharyngitis (4%), rhinitis (7%), lung disorder (2%), asthma (1%), epistaxis (1%)

Miscellaneous: Diaphoresis

Postmarketing and/or case reports: Agranulocytosis, anaphylactic reaction, angioedema, DRESS syndrome, erythema multiforme, hypersensitivity syndrome (multiorgan), mania, psychosis, Stevens-Johnson syndrome, toxic epidermal necrolysis

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 2A6 (weak), 2C9 (weak), 2C19 (strong), 2E1 (weak), 3A4 (weak); **Induces** CYP1A2 (weak), 2B6 (weak), 3A4 (weak)

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Modafinil may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol.

Food: Delays absorption, but does not affect bioavailability.

Monitoring Parameters Levels of sleepiness; blood pressure in patients with hypertension

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Nursing: Physical Assessment/Monitoring Assess effectiveness and interactions of other medications, especially those that are metabolized by P450 enzymes. Note that modafinil has potential for abuse; caution patient about inappropriate or overuse. Perform careful cardiovascular assessment prior to initiating therapy. Assess knowledge/teach patient appropriate use, adverse symptoms to report. and interventions to reduce side effects.

Patient Education Take exactly as prescribed; do not exceed recommended dosage without consulting prescriber. Avoid drinking alcohol. Do not share medication with anyone else. Void before taking medication. You may experience headache, nervousness, confusion, or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); diarrhea (yogurt or buttermilk may help); or dry mouth or sore mouth, loss of appetite, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). If you have diabetes, monitor glucose levels closely. Report chest pain or palpitations; respiratory difficulty; excessive insomnia, CNS agitation, depression, or memory disturbances; rash; vision changes; changes in urinary pattern or ejaculation disturbances; or persistent joint pain or stiffness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Provigil®: 100 mg, 200 mg

Generic Available No

Pricing: U.S. (www.drugstore.com)

Tablets (Provigil)

100 mg (30): $248.91

200 mg (30): $348.63

Mechanism of Action The exact mechanism of action is unclear, it does not appear to alter the release of dopamine or norepinephrine, it may exert its stimulant effects by decreasing GABA-mediated neurotransmission, although this theory has not yet been fully evaluated; several studies also suggest that an intact central alpha-adrenergic system is required for modafinil's activity; the drug increases high-frequency alpha waves while decreasing both delta and theta wave activity, and these effects are consistent with generalized increases in mental alertness

Pharmacodynamics/Kinetics Modafinil is a racemic compound (10% *d*-isomer and 90% *l*-isomer at steady state) whose enantiomers have different pharmacokinetics

Distribution: V_d: 0.9 L/kg

Protein binding: 60%, primarily to albumin

Metabolism: Hepatic; multiple pathways including CYP3A4

Half-life elimination: Effective half-life: 15 hours; Steady-state: 2-4 days

Time to peak, serum: 2-4 hours

Excretion: Urine (as metabolites, <10% as unchanged drug)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), oral ulceration, gingivitis, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use vasoconstrictor with caution. Patients may experience heart palpitations and increased heart rate when taking modafinil.

Mental Health: Child/Adolescent Considerations Across three large randomized, double-blind, placebo-controlled trials, a total of 638 children and adolescents (range: 6-17 years of age) with ADHD were treated with modafanil (170-425 mg once daily) or placebo for 7-9 weeks (Biederman, 2005; Greenhill, 2006; Swanson, 2006). Modafanil treatment was associated with significant decreases in the ADHD-RS-IV scores compared relative to baseline and significantly compared to placebo ($p<0.0001$) for all three studies. Despite the demonstrated efficacy, these studies revealed a high rate of serious dermatological reactions (including Stevens-Johnson syndrome) in these patients.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(mo EKS i pril & hye droe klor oh THYE a zide)

U.S. Brand NamesUniretic®

Canadian Brand NamesUniretic®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension; not indicated for initial treatment of hypertension

Dosing: Adults**Hypertension:** Oral: 7.5-30 mg of moexipril, taken either in a single or divided dose one hour before meals; hydrochlorothiazide dose should be ≤50 mg/day

Dosing: ElderlyOverall safety and efficacy are not different in elderly patients, although a higher moexipril AUC was observed in elderly patients. Greater sensitivity to effects may be observed in some older individuals. Refer to adult dosing.

ContraindicationsHypersensitivity to moexipril, hydrochlorothiazide, sulfonamide-derived drugs, or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor; anuria

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See "Special populations" below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use ACE inhibitors with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use moexipril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use ACE inhibitors with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective). Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy Considerations

[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected. See individual agents.

LactationEnters breast milk/use caution
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential
Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [scored]:

7.5/12.5: Moexipril hydrochloride 7.5 mg and hydrochlorothiazide 12.5 mg

15/12.5: Moexipril hydrochloride 15 mg and hydrochlorothiazide 12.5 mg

15/25: Moexipril hydrochloride 15 mg and hydrochlorothiazide 25 mg

Uniretic®:

7.5/12.5: Moexipril hydrochloride 7.5 mg and hydrochlorothiazide 12.5 mg

15/12.5: Moexipril hydrochloride 15 mg and hydrochlorothiazide 12.5 mg

15/25: Moexipril hydrochloride 15 mg and hydrochlorothiazide 25 mg

Generic AvailableYes

ManufacturerSchwarz Pharma

Pricing: U.S. (www.drugstore.com)

Tablets (Moexipril-Hydrochlorothiazide)

7.5-12.5 mg (30): $37.99

15-12.5 mg (100): $109.98

15-25 mg (30): $36.99

Tablets (Uniretic)

Related Information

- Hydrochlorothiazide
- Moexipril

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness; may rarely cause anxiety or mood changes

Mental Health: Effects on Psychiatric TreatmentThiazides and ACE inhibitors may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels; may cause neutropenia; use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for moexipril and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. ACE inhibitors and thiazides are also standard therapy for left ventricular systolic dysfunction. See Cardiovascular Considerations for individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Moexipril may be confused with Monopril®

Pronunciation(mo EKS i pril)

U.S. Brand NamesUnivasc®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension, alone or in combination with thiazide diuretics

Dosing: Adults**Hypertension, LV dysfunction (post MI):** Oral: Initial: 7.5 mg once daily (in patients **not** receiving diuretics), 1 hour prior to a meal **or** 3.75 mg once daily (when combined with thiazide diuretics); maintenance dose: 7.5-30 mg/day in 1 or 2 divided doses 1 hour before meals

Dosing: ElderlyDose the same as adults; adjust for renal impairment. Tablet may be cut in half (3.75 mg) for starting therapy (see Renal Impairment).

Dosing: Renal ImpairmentCl_{cr} ≤40 mL/minute: Patients may be cautiously placed on 3.75 mg once daily, then upwardly titrated to a maximum of 15 mg/day.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsAdminister on an empty stomach.

ContraindicationsHypersensitivity to moexipril or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with congestive heart failure and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion; use lowest dose recommendations initially; adjust dose for renal function in the elderly. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, moexipril is considered pregnancy category C during the first trimester. Based on human data, moexipril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if moexipril is excreted into breast milk. The manufacturer recommends that caution be exercised when administering moexipril to nursing women.

Pregnancy & Lactation, In-Depth

- Moexipril in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Cardiovascular: Hypotension, peripheral edema

Central nervous system: Dizziness, fatigue, headache

Dermatologic: Alopecia, flushing, rash

Endocrine & metabolic: Hyperkalemia, hyponatremia

Gastrointestinal: Diarrhea, heartburn, nausea

Genitourinary: Polyuria

Neuromuscular & skeletal: Myalgia

Renal: Reversible increases in creatinine or BUN

Respiratory: Cough, pharyngitis, sinusitis, upper respiratory infection

<1% (Limited to important or life-threatening): Alopecia, anemia, angioedema, arrhythmia, bronchospasm, cerebrovascular accident, chest pain, dyspnea, eosinophilic pneumonitis, hepatitis, hypercholesterolemia, LFTs increased, MI, oliguria, orthostatic hypotension, palpitation, proteinuria, syncope

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Food may delay and reduce peak serum levels.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Test InteractionsIncreases BUN, creatinine, potassium, positive Coombs' [direct]; decreases cholesterol (S); may cause false-positive results in urine acetone determinations using sodium nitroprusside reagent

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact fluid balance or cardiac status). Evaluate results of laboratory tests on a regular basis during therapy. Patient should be monitored closely for anaphylactic reaction or angioedema which can occur at any time during treatment and may involve head and neck. Evaluate therapeutic effectiveness (blood pressure) and adverse responses (eg, hypotension, rash, diarrhea, myalgia, electrolyte imbalance) regularly during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Do not use potassium supplements or salt substitutes without consulting prescriber. Take exactly as directed; do not discontinue without consulting prescriber. Take first dose at bedtime. Take all doses on an empty stomach, 1 hour before or 2 hours after meals. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); nausea, vomiting, abdominal pain, dry mouth, or transient loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report immediately unusual swelling of mouth, tongue, face, throat. Report respiratory difficulty or unusual cough, rash, excessive urination, chest pain or palpitations, mouth sores, fever or chills, numbness, tingling or pain in muscles, or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride [scored]: 7.5 mg, 15 mg

Univasc®: 7.5 mg, 15 mg

Generic AvailableYes

ManufacturerSchwarz Pharma

Pricing: U.S. (www.drugstore.com)

Tablets (Moexipril HCl)

7.5 mg (30): $36.99

15 mg (30): $34.99

Tablets (Univasc)

7.5 mg (30): $51.99

15 mg (30): $53.84

Mechanism of ActionCompetitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion

Pharmacodynamics/Kinetics

Absorption: Incomplete

Onset of action: Peak effect: 1-2 hours

Duration: >24 hours

Distribution: V_d (moexiprilat): 180 L

Protein binding, plasma: Moexipril: 90%; Moexiprilat: 50% to 70%

Metabolism: Parent drug: Hepatic and via GI tract to moexiprilat, 1000 times more potent than parent

Bioavailability: Moexiprilat: 13%; reduced with food (AUC decreased by ~40%)

Half-life elimination: Moexipril: 1 hour; Moexiprilat: 2-9 hours

Time to peak: 1.5 hours

Excretion: Feces (50%)

Related Information

- Angiotensin Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness; may rarely cause anxiety or mood changes

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, or history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n = 6110) or placebo (n = 6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p = 0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Index TermsMoexipril Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Molindone may be confused with Mobidin®

Moban® may be confused with Mobidin®, Modane®

Pronunciation(moe LIN done)

U.S. Brand NamesMoban®

Canadian Brand NamesMoban®

Pharmacologic CategoryAntipsychotic Agent, Typical

Use: Labeled IndicationsManagement of schizophrenia

Use: Unlabeled/InvestigationalManagement of psychotic disorders; behavioral symptoms associated with dementia (elderly); psychosis/agitation related to Alzheimer's dementia

Dosing: Adults**Schizophrenia/psychoses:** Oral:

Initial: 50-75 mg/day, may increase to 100 mg/day in 3-4 days; may further increase dose gradually to maximum of 225 mg/day

Maintenance: 5-15 mg (mild symptoms) or 10-25 mg (moderate symptoms) 3-4 times/day (up to 225 mg/day may be required in severe cases)

Dosing: ElderlyBehavioral symptoms associated with dementia in the elderly (unlabeled use): Oral: Initial: 5-10 mg 1-2 times/day; increase at 4- to 7-day intervals by 5-10 mg/day; increase dosing intervals (eg, twice daily, 3 times/day) as necessary to control response or side effects. Maximum dose: 112 mg/day. Gradual increases (titration) may prevent some side effects or decrease their severity.

Dosing: Pediatric**Schizophrenia/psychosis (unlabeled use):** Oral: Children:

3-5 years: 1-2.5 mg/day divided into 4 doses

5-12 years: 0.5-1 mg/kg/day in 4 divided doses

StorageStore at controlled room temperature of 25°C (77°F). Protect from light.

ContraindicationsHypersensitivity to molindone or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression; coma

Allergy Considerations

- Molindone Allergy

Warnings/Precautions

Boxed warnings:

- Dementia: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Avoid use in patients with underlying QT prolongation, in those taking medicines that prolong the QT interval, or cause polymorphic ventricular tachycardia; monitor ECG closely for dose-related QT effects.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, molindone has a low potency of cholinergic blockade.

- Blood dyscrasias: Myelosuppression (eg, leukopenia, agranulocytosis) has been observed with antipsychotic use; check blood counts periodically and discontinue at first signs of blood dyscrasias.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is moderate-high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May rarely cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Molindone is not approved for this indication.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Phenytoin/tetracyclines: Due to calcium sulfate content in the tablet, concomitant use may decrease the absorption of phenytoin and tetracyclines.

Special populations:

- Debilitated/elderly patients: Initiate therapy at a reduced dose; may be more susceptible to adverse effects.

Geriatric Considerations Any changes in disease status in any organ system can result in behavior changes.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen, fluid electrolyte loss, infections, and changes in environment.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk Factor C

Lactation Excretion in breast milk unknown

Adverse Reactions Frequency not defined.

Cardiovascular: Arrhythmia, orthostatic hypotension, tachycardia, T wave changes (transient; rare)

Central nervous system: Central temperature regulation altered, drowsiness, euphoria, extrapyramidal reactions (akathisia, pseudoparkinsonism, dystonia, tardive dyskinesia), hyperactivity, mental depression, neuroleptic malignant syndrome (NMS), restlessness, sedation, seizure

Dermatologic: Rash

Endocrine & metabolic: Amenorrhea, change in menstrual periods, galactorrhea, gynecomastia, libido increased

Gastrointestinal: Constipation, nausea, salivation, weight gain (minimal compared to other antipsychotics), weight loss, xerostomia

Genitourinary: Priapism, urinary retention

Hematologic: Leukopenia (rare), leukocytosis (rare)

Hepatic: Liver function tests altered (rare)

Ocular: Blurred vision, lens opacities, retinal pigmentation

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring Parameters Vital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Nursing: Physical Assessment/Monitoring Assess other medications patient is taking for effectiveness and interactions. Review ophthalmic screening and monitor laboratory results, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}, baseline liver and kidney function, CBC prior to and periodically during therapy; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; do not discontinue without consulting prescriber. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience excess drowsiness, restlessness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); or decreased perspiration (avoid strenuous exercise in hot environments). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; changes in menstrual pattern or breast tenderness; vision changes; skin rash or yellowing of skin; respiratory difficulty; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 5 mg, 10 mg, 25 mg, 50 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Moban)

5 mg (90): $119.99

10 mg (90): $166.99

25 mg (90): $246.97

50 mg (90): $323.24

Mechanism of ActionMolindone is a dihydroindoline antipsychotic whose mechanism of action mimics that of chlorpromazine; however, it produces more extrapyramidal symptoms and less sedation than chlorpromazine

Pharmacodynamics/Kinetics

Metabolism: Hepatic

Half-life elimination: 1.5 hours

Time to peak, serum: ~1.5 hours

Excretion: Urine and feces (90%) within 24 hours

- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation) and orthostatic hypotension. Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease). Molindone can cause extrapyramidal reactions which may appear as muscle twitching or increased motor activity of the face, neck, or head.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentMolindone is not commonly used, and is an intermediate-potency antipsychotic. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Medication Safety Issues

Sound-alike/look-alike issues:

Elocon® lotion may be confused with ophthalmic solutions. Manufacturer's labeling emphasizes the product is **NOT** for use in the eyes.

Pronunciation(moe MET a sone)

U.S. Brand NamesAsmanex® Twisthaler®; Elocon®; Nasonex®

Canadian Brand NamesElocom®; Nasonex®; PMS-Mometasone; ratio-Mometasone; Taro-Mometasone

Pharmacologic CategoryCorticosteroid, Inhalant (Oral); Corticosteroid, Nasal; Corticosteroid, Topical

Use: Labeled IndicationsRelief of the inflammatory and pruritic manifestations of corticosteroid-responsive dermatoses (medium potency topical corticosteroid); treatment of nasal symptoms of seasonal and perennial allergic rhinitis; prevention of nasal symptoms associated with seasonal allergic rhinitis; treatment of nasal polyps in adults; maintenance treatment of asthma as prophylactic therapy or as a supplement in asthma patients requiring oral corticosteroids for the purpose of decreasing or eliminating the oral corticosteroid requirement

Dosing: Adults

Treatment of seasonal and perennial allergic rhinitis: Nasal spray: 2 sprays (100 mcg) in each nostril daily

Prevention of seasonal and perennial allergic rhinitis: Nasal spray: 2 sprays (100 mcg) in each nostril daily beginning 2-4 weeks prior to pollen season

Treatment of corticosteroid-responsive dermatoses: Topical: Apply sparingly, do not use occlusive dressings. Therapy should be discontinued when control is achieved; if no improvement is seen in 2 weeks, reassessment of diagnosis may be necessary.

Cream, ointment: Apply a thin film to affected area once daily

Lotion: Apply a few drops to affected area once daily

Treatment of nasal polyps: Nasal spray: 2 sprays (100 mcg) in each nostril twice daily; 2 sprays (100 mcg) once daily may be effective in some patients

Asthma: Oral inhalation:

Bronchodilators or inhaled corticosteroids: Initial: 1 inhalation (220 mcg) daily (maximum 2 inhalations or 440 mcg/day); may be given in the evening or in divided doses twice daily

Oral corticosteroids: Initial: 440 mcg twice daily (maximum 880 mcg/day); prednisone should be reduced no faster than 2.5 mg/day on a weekly basis, beginning after at least 1 week of mometasone furoate use

NIH Asthma Guidelines (NIH, 2007):

"Low" dose: 220 mcg/day

"Medium" dose: 440 mcg/day

"High" dose: >440 mcg/day

Note: Maximum effects may not be evident for 1-2 weeks or longer; dose should be titrated to effect, using the lowest possible dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of seasonal and perennial allergic rhinitis treatment:

Nasal spray:

Children 2-11 years: 1 spray (50 mcg) in each nostril daily

Children ≥12 years: Refer to adult dosing.

Treatment of corticosteroid-responsive dermatoses: Topical:

Cream, ointment: Children ≥2 years: Refer to adult dosing. Do not use in pediatric patients for longer than 3 weeks.

Lotion: Children ≥12 years: Refer to adult dosing.

Asthma: Oral inhalation:

Children 4-11 years: 110 mcg once daily in the evening (maximum 110 mcg/day)

Children ≥12 years: Refer to adult dosing.

Administration: Inhalation

Nasal spray: Prior to first use, prime pump by actuating 10 times or until fine spray appears; may store for a maximum of 1 week without repriming. Spray should be administered once or twice daily, at a regular interval. Shake well prior to use.

Oral inhalation: Exhale fully prior to bringing the Twisthaler® up to the mouth. Place between lips and inhale quickly and deeply. Do not breathe out through the inhaler. Remove inhaler and hold breath for 10 seconds if possible.

Administration: Topical

Apply sparingly; avoid eyes, face, underarms, and groin. Do not wrap or bandage affected area.

Dietary Considerations

Asmanex® Twisthaler® contains lactose.

Storage

Cream: Store between 2°C to 25°C (36°F to 77°F).

Lotion: Store between 2°C to 30°C (36°F to 86°F).

Nasal spray: Store at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

Ointment: Store at room temperature of 15°C to 30°C (59°F to 86°F).

Oral Inhaler: Store at room temperature of 25°C (77°F). Discard when oral dose counter reads "00" (or 45 days after opening the foil pouch).

Contraindications

Hypersensitivity to mometasone or any component of the formulation; treatment of acute bronchospasm (oral inhaler)

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Bronchospasm: May occur with wheezing after inhalation; if this occurs stop steroid and treat with a fast-acting bronchodilator.

- Delayed wound healing: Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery or nasal trauma until healing has occurred.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided. Corticosteroids should not be used to treat ocular herpes simplex, cerebral malaria, or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Asthma: Supplemental steroids (oral or parenteral) may be needed during stress or severe asthma attacks. Not to be used in status asthmaticus or for the relief of acute bronchospasm.

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with or who are at risk for osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range: 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients.

Other warnings/precautions:

- Appropriate use: Prior to use, the dose and duration of treatment should be based on the risk versus benefit for each individual patient. In general, use the smallest effective dose for the shortest duration of time to minimize adverse events. A gradual tapering of dose may be required prior to discontinuing therapy. There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing inhalation therapy.

- Transfer to oral inhaler: When transferring to oral inhaler, previously-suppressed allergic conditions (rhinitis, conjunctivitis, eczema) may be unmasked.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using topical or inhaled mometasone during pregnancy. However, teratogenicity and intrauterine growth retardation has been reported in animal studies with some topical steroids. Avoid use of large amounts for long periods of time during pregnancy. Hypoadrenalism may occur in infants born to women receiving corticosteroids during pregnancy. Monitor these infants closely after birth. Following oral inhalation, <1% of a single 400 mcg dose is available systemically in the mother; inhaled corticosteroids are considered first-line agents for the treatment of persistent of asthma during pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSystemic corticosteroids are excreted in human milk. The extent of topical absorption is variable; do not apply topical products to nipples. Following oral inhalation, <1% of a single 400 mcg dose is available systemically which would limit the amount available in breast milk.

Adverse Reactions

Nasal/oral inhalation:

>10%:

Central nervous system: Headache (17% to 26%), fatigue (oral inhalation 1% to 13%), depression (oral inhalation 11%)

Neuromuscular & skeletal: Musculoskeletal pain (1% to 22%), arthralgia (oral inhalation 13%)

Respiratory: Rhinitis (2% to 20%), upper respiratory infection (5% to 15%), pharyngitis (8% to 13%), cough (nasal inhalation 7% to 13%), epistaxis (1% to 11%)

Miscellaneous: Viral infection (nasal inhalation 8% to 14%), oral candidiasis (oral inhalation 4% to 22%)

1% to 10%:

Cardiovascular: Chest pain

Central nervous system: Pain

Gastrointestinal: Abdominal pain, anorexia, dry throat (oral inhalation), diarrhea, dyspepsia, flatulence, gastroenteritis, nausea, vomiting

Genitourinary: Dysmenorrhea

Neuromuscular & skeletal: Back pain, myalgia

Ocular: Conjunctivitis

Otic: Earache, otitis media

Respiratory: Asthma, bronchitis, dysphonia, nasal irritation, sinusitis, wheezing

Miscellaneous: Accidental injury, flu-like syndrome

<1%: Nasal candidiasis, nasal ulcers, oral candidiasis (nasal inhalation)

Postmarketing and/or case reports: Anaphylaxis, angioedema, growth suppression, nasal burning and irritation, nasal septal perforation, smell disturbance (rare), taste disturbance (rare)

Topical:

1% to 10%: Dermatologic: Bacterial skin infection, burning, furunculosis, pruritus, skin atrophy, tingling/stinging

<1%: Folliculitis, glucocorticoid levels decreased (pediatric patients), moniliasis, paresthesia, skin depigmentation, skin atrophy

Postmarketing and/or case reports: Rosacea

Cataract formation, reduction in growth velocity, and HPA axis suppression have been reported with other corticosteroids

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)
Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersHPA axis suppression

Asthma: FEV_1, peak flow, and/or other pulmonary function tests

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess patient response. Teach patient proper use (according to formulation), side effects/appropriate interventions, and symptoms to report. Long-term use: Assess for glaucoma and cataracts periodically. Monitor growth with long-term use in pediatric patients.
Patient EducationDo not take anything new during treatment without consulting prescriber. Use exactly as directed and for no longer than the period prescribed. Not a bronchodilator and not indicated for relief of bronchospasm or acute episodes of asthma. May take 1-2 weeks before effects of medication are seen. Avoid exposure to chickenpox or measles. Consult prescriber immediately if exposure does occur. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Nasal: Read complete instructions in package. Prime the pump as directed. Gently blow your nose to clear nostrils. Close one nostril. Tilt your head forward slightly and, keeping the bottle upright, carefully insert the nasal applicator into the other nostril. After the spray, breath gently inward through the nostril, then breath out through the mouth. Repeat in other nostril. You may experience headache, cough, or nosebleed. Report unusual chest pain, gastrointestinal upset, muscle pain, flu-like symptoms, other persistent adverse reactions, worsening of condition or failure to improve. Store at room temperature, away from light.

Topical: Do not use for eyes, mucous membranes, or open wounds. Use exactly as directed and for no longer than the period prescribed. Before using, wash and dry area gently. Apply in a thin layer (cream, ointment) or a few drops (lotion) and rub in lightly. Apply light dressing (if necessary) to area being treated. Do not use occlusive dressing unless so advised by prescriber. Avoid prolonged or excessive use around sensitive tissues, underarms, genital, or rectal areas. Avoid exposing treated area to direct sunlight (severe sunburn may occur). Inform prescriber if condition worsens (redness, swelling, irritation, signs of infection, or open sores) or fails to improve.

Oral inhalation: Discard inhaler 45 days after opening foil pouch or when dose counter reads "00." Rinse mouth after using. Keep the inhaler clean and dry.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical, as furoate: 0.1% (15 g, 45 g)

Elocon®: 0.1% (15 g, 45 g)

Lotion, topical, as furoate: 0.1% (30 mL, 60 mL)

Elocon®: 0.1% (30 mL, 60 mL) [contains isopropyl alcohol 40%]

Ointment, topical, as furoate: 0.1% (15 g, 45 g)

Elocon®: 0.1% (15 g, 45 g)

Powder for oral inhalation, as furoate:

Asmanex® Twisthaler®: 110 mcg (30 units) [contains lactose; delivers 100 mcg/actuation]; 220 mcg (14 units, 30 units, 60 units, 120 units) [contains lactose; delivers 200 mcg/actuation]

Suspension, intranasal, as furoate [spray]:

Nasonex®: 50 mcg/spray (17 g) [delivers 120 sprays; contains benzalkonium chloride]

Suspension (Nasonex)

50 mcg/ACT (17): $100.81

Mechanism of ActionMay depress the formation, release, and activity of endogenous chemical mediators of inflammation (kinins, histamine, liposomal enzymes, prostaglandins). Leukocytes and macrophages may have to be present for the initiation of responses mediated by the above substances. Inhibits the margination and subsequent cell migration to the area of injury, and also reverses the dilatation and increased vessel permeability in the area resulting in decreased access of cells to the sites of injury.

Pharmacodynamics/Kinetics

Absorption:

Nasal inhalation: Mometasone furoate monohydrate: Undetectable in plasma

Ointment: 0.7%; increased by occlusive dressings

Oral inhalation: Systemic absorption <1%

Protein binding: Mometasone furoate: 98% to 99%

Metabolism: Mometasone furoate: Hepatic via CYP3A4; forms metabolite

Half-life elimination: Oral inhalation: 5 hours

Excretion: Feces, bile, urine

Related Information

- Corticosteroids

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, dizziness, euphoria, fatigue, insomnia, mood swings, and personality changes; may cause exacerbation of pre-existing psychiatric conditions

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: For patients who have received oral systemic corticosteroids during the past 6 months and for selected patients on long-term, high-dose, inhaled corticosteroid (ICS), give stress doses of hydrocortisone intravenously during the surgical period and reduce the dose rapidly within 24 hours after surgery (Expert Panel Report 3, 2007). Clinically important adrenal suppression has been reported in patients receiving high doses of an ICS, particularly children.

Index TermsMometasone Furoate

Pronunciation(mon oh BEN zone)
U.S. Brand NamesBenoquin®
Pharmacologic CategoryTopical Skin Product
Use: Labeled IndicationsFinal depigmentation in extensive vitiligo
Dosing: Adults**Vitiligo:** Topical: Apply 2-3 times daily; once desired degree of pigmentation is obtained, may apply as needed (usually 2 times/week)
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Vitiligo:** Topical: Children ≥12 years: Refer to adult dosing.
Administration: TopicalApply thin layer to affected area.
StorageStore at 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to monobenzone or any component of the formulation; use as cosmetic skin bleach; use as hydroquinone substitute
Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: Skin will be sensitive to the sun following application and for the rest of the patient's life; sunscreen must be used.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: For external use only. For use only as a final depigmentation in extensive vitiligo; not recommended for use in freckling, hyperpigmentation caused by photosensitization, melasma, hyperpigmentation resulting from skin inflammation, cafe-au-lait spots, pigmented nevi, or malignant melanoma.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Local: Burning sensation, depigmentation of skin distant to application site, dermatitis, irritation

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical: 20% (35 g)

Generic AvailableNo
ManufacturerICN Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Cream (Benoquin)

20% (35.4): $54.99

Mechanism of ActionIncreases excretion of melanin from melanocytes; causes melanocyte destruction and permanent depigmentation
Pharmacodynamics/KineticsOnset of action: 1-4 months
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
International Brand NamesBenoquin (IN); Monobenzone (PL)

Special Alerts

Montelukast (Singulair®) and the Possible Association With Behavior/Mood Changes and Suicide - March 2008

The Food and Drug Administration (FDA) is informing healthcare professionals of the possible association between montelukast (Singulair®) use and suicidality (suicidal thinking and behavior), suicide, and behavior or mood changes. This review is ongoing and the FDA will continue to work with Merck & Co, Inc. to further evaluate this possible association of suicidality with montelukast use. The analysis is expected to take up to 9 months before completion. After the completed evaluation, the FDA will communicate any final conclusions to the public. The FDA is also reviewing postmarketing reports of behavior/mood changes, suicidality, and suicide received with other leukotriene-modifying medications, including zafirlukast (Accolate®) and zileuton (Zyflo®, Zyflo CR™), to determine if further evaluation of these agents is necessary. Patients should not discontinue Singulair® therapy and should discuss any concerns with their healthcare provider. Healthcare professionals and caregivers should monitor for any changes in behavior or mood in patients receiving montelukast.

Additional information can be found at

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Singulair

Medication Safety Issues

Sound-alike/look-alike issues:

Singulair® may be confused with Sinequan®

Pronunciation(mon te LOO kast)

U.S. Brand NamesSingulair®

Canadian Brand NamesSingulair®

Pharmacologic CategoryLeukotriene Receptor Antagonist

Use: Labeled IndicationsProphylaxis and chronic treatment of asthma; relief of symptoms of seasonal allergic rhinitis and perennial allergic rhinitis; prevention of exercise-induced bronchospasm

Use: Unlabeled/InvestigationalAcute asthma

Dosing: Adults

Asthma, allergic seasonal or perennial rhinitis: Oral: One 10 mg tablet daily in the evening

Asthma, acute (unlabeled use): 10 mg as a single dose administered with first-line therapy

Bronchoconstriction, exercise-induced (prevention): 10 mg at least 2 hours prior to exercise; additional doses should not be administered within 24 hours. Daily administration to prevent exercise-induced bronchoconstriction has not been evaluated.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Asthma: Oral:

6-11 months (unlabeled use): 4 mg (oral granules) once daily, taken in the evening

12-23 months: 4 mg (oral granules) once daily, taken in the evening

Seasonal or perennial allergic rhinitis: Oral: *6-23 months:* 4 mg (oral granules) once daily

Asthma, seasonal or perennial allergic rhinitis: Oral:

2-5 years: 4 mg (chewable tablet or oral granules) once daily, taken in the evening

6-14 years: 5 mg (chewable tablet) once daily, taken in the evening

≥15 years: Refer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentNo adjustment necessary in mild-to-moderate hepatic disease. Patients with severe hepatic disease were **not** studied.

Administration: OralWhen treating asthma, administer dose in the evening. Patients with allergic rhinitis may individualize administration time. Granules may be administered directly in the mouth or mixed with applesauce, carrots, rice, ice cream, baby formula, or breast milk; do not add to any other liquids. Administer within 15 minutes of opening packet.

Dietary ConsiderationsTablet, chewable: 4 mg strength contains phenylalanine 0.674 mg; 5 mg strength contains phenylalanine 0.842 mg

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from moisture and light.

Granules: Use within 15 minutes of opening packet.

ContraindicationsHypersensitivity to montelukast or any component of the formulation

Allergy Considerations

- Leukotriene Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Eosinophilia and vasculitis: In rare cases, patients may present with systemic eosinophilia, sometimes presenting with clinical features of vasculitis consistent with Churg-Strauss syndrome, a condition which is often treated with systemic corticosteroid therapy. Healthcare providers should be alert to eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, and/or neuropathy presenting in their patients. A causal association between montelukast and these underlying conditions has not been established.

Concurrent drug therapy issues:

- Corticosteroids: Appropriate clinical monitoring and caution are recommended when systemic corticosteroid reduction is considered in patients receiving montelukast.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 months of age.

Dosage form specific issues:

- Chewable tablet: Contains phenylalanine.

Other warnings/precautions:

- Aspirin-sensitive asthmatics: Montelukast will not interrupt bronchoconstrictor response to aspirin or other NSAIDs. Patients with known aspirin sensitivity should continue to avoid these agents.

- Reversal of bronchospasm: Not FDA approved for use in the reversal of bronchospasm in acute asthma attacks, including status asthmaticus. Some clinicians, however, support its use (Cylly, 2003; Camargo, 2003; Ferreira, 2001). Appropriate rescue medication should be available.

Geriatric ConsiderationsThe pharmacokinetic profile in the elderly is similar to younger adults except the half-life is slightly longer in the elderly. Despite this difference, no adjustment in dose is necessary in the elderly. Elimination is mostly fecal and bile with insignificant amounts from renal elimination, which is an advantage for the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsMontelukast was not teratogenic in animal studies, however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed. Based on limited data, structural defects have been reported in neonates exposed to montelukast *in utero*, however, a specific pattern and relationship to montelukast has not been established. Healthcare providers should report any prenatal exposures to the montelukast pregnancy registry at (800) 986-8999.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsZafirlukast, another leukotriene receptor antagonist, is excreted in breast milk and use while breast-feeding is not recommended.

Adverse Reactions(As reported in adults)

1% to 10%:

Central nervous system: Dizziness (2%), fatigue (2%), fever (2%)

Dermatologic: Rash (2%)

Gastrointestinal: Abdominal pain (3%), dyspepsia (2%), dental pain (2%), gastroenteritis (2%)

Hepatic: AST increased (2%)

Neuromuscular & skeletal: Weakness (2%)

Respiratory: Cough (3%), nasal congestion (2%)

Postmarketing and/or case reports: Aggression, agitation, anaphylaxis, angioedema, arthralgia, behavior/mood changes, bleeding tendency, bruising, cholestasis (rare), Churg-Strauss syndrome (rare), depression, diarrhea, dream abnormalities, drowsiness, dyspepsia, edema, eosinophilia (systemic; rare), erythema nodosum, hallucinations, hepatic eosinophilic infiltration (rare); hepatitis (mixed pattern, hepatocellular, and cholestatic); hypersensitivity, hypoesthesia, insomnia, irritability, muscle cramps, myalgia, nausea, palpitation, pancreatitis (rare), paresthesia, pruritus, psychomotor hyperactivity, restlessness, seizure (rare), suicidal thinking/behavior (suicidality), suicide, tremor, urticaria, vasculitis (rare), vomiting

Metabolism/Transport Effects**Substrate** (major) of CYP2C9, 3A4; **Inhibits** CYP2C8 (weak), 2C9 (weak)

Drug Interactions

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease montelukast levels.

Monitoring ParametersMood or behavior changes, including suicidal thinking/behavior

Nursing: Physical Assessment/MonitoringNot for use in acute asthma attacks, including status asthmaticus. Assess effectiveness and interactions of other medications patient may be taking. Monitor mental and mood status. Be alert to thoughts of suicide. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not stop other asthma medication unless advised by prescriber. Chewable tablet contains phenylalanine. Take every evening on a continuous basis; do not discontinue even if feeling better (this medication may help reduce incidence of acute attacks). Granules may be administered directly in the mouth or mixed with applesauce, carrots, rice, ice cream, baby formula, or breast milk (do not add to any other liquids); administer within 15 minutes of opening packet. You may experience mild headache (mild analgesic may help); or fatigue or dizziness (use caution when driving). Report skin rash or itching, abdominal pain or persistent GI upset, unusual cough or congestion, behavior and mood changes including suicide thoughts, feeling of numbness in arms or legs, flu-like illness, or worsening of asthmatic condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

4 mg (30): $121.14

Tablets (Singulair)

10 mg (30): $116.73

Mechanism of ActionSelective leukotriene receptor antagonist that inhibits the cysteinyl leukotriene receptor. Cysteinyl leukotrienes and leukotriene receptor occupation have been correlated with the pathophysiology of asthma, including airway edema, smooth muscle contraction, and altered cellular activity associated with the inflammatory process, which contribute to the signs and symptoms of asthma. Cysteinyl leukotrienes are also released from the nasal mucosa following allergen exposure leading to symptoms associated with allergic rhinitis.

Pharmacodynamics/Kinetics

Duration: >24 hours

Absorption: Rapid

Distribution: V_d: 8-11 L

Protein binding, plasma: >99%

Metabolism: Extensively hepatic via CYP3A4 and 2C9

Bioavailability: Tablet: 10 mg: Mean: 64%; 5 mg: 63% to 73%

Half-life elimination, plasma: Mean: 2.7-5.5 hours

Time to peak, serum: Tablet: 10 mg: 3-4 hours; 5 mg: 2-2.5 hours; 4 mg: 2 hours

Excretion: Feces (86%); urine (<0.2%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dental pain.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness or drowsiness

Mental Health: Effects on Psychiatric Treatment Barbiturates may decrease the effects of montelukast; CYP3A4 substrate; nefazodone may increase effects

Index Terms Montelukast Sodium

[total dose/cycle = 12 units/m^2]

Vinblastine: I.V.: 6 mg/m^2/day days 1 and 15

[total dose/cycle = 12 mg/m^2]

Dacarbazine: I.V.: 250 mg/m^2/day days 1 and 15

[total dose/cycle = 500 mg/m^2]

Each regimen cycle is 28 days. Administer regimens in alternating fashion as follows: 2 cycles of MOPP alternating with 2 cycles of ABVD for a total of 8 cycles

Variation 5 (pediatrics):

Mechlorethamine: I.V.: 6 mg/m^2/day days 1 and 8

[total dose/cycle = 12 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2/day days 1 and 8

[total dose/cycle = 2.8 mg/m^2]

Procarbazine: Oral: 100 mg/m^2/day days 1 to 14

[total dose/cycle = 1400 mg/m^2]

Prednisone: Oral: 40 mg/m^2/day days 1 to 14

[total dose/cycle = 560 mg/m^2]

Doxorubicin: I.V.: 25 mg/m^2/day days 29 and 42

[total dose/cycle = 50 mg/m^2]

Bleomycin: I.V.: 10 units/m^2/day days 29 and 42

[total dose/cycle = 20 units/m^2]

Vinblastine: I.V.: 6 mg/m^2/day days 29 and 42

[total dose/cycle = 12 mg/m^2]

Dacarbazine: I.V.: 150 mg/m^2/day days 29 to 33

[total dose/cycle = 750 mg/m^2]

Repeat cycle every 56 days for 4 cycles

Variation 6 (pediatrics):

Mechlorethamine: I.V.: 6 mg/m^2/day days 1 and 8

[total dose/cycle = 12 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2/day days 1 and 8

[total dose/cycle = 2.8 mg/m^2]

Procarbazine: Oral: 100 mg/m^2/day days 1 to 14

[total dose/cycle = 1400 mg/m^2]

Prednisone: Oral: 40 mg/m^2/day days 1 to 14

[total dose/cycle = 560 mg/m^2]

Doxorubicin: I.V.: 25 mg/m^2/day days 29 and 42

[total dose/cycle = 50 mg/m^2]

Bleomycin: I.V.: 10 units/m^2/day days 29 and 42

[total dose/cycle = 20 units/m^2]

Vinblastine: I.V.: 6 mg/m^2/day days 29 and 42

[total dose/cycle = 12 mg/m^2]

Dacarbazine: I.V.: 375 mg/m^2/day days 29 and 43

[total dose/cycle = 750 mg/m^2]

Repeat cycle every 56 days for 4 cycles

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ethmozine® may be confused with Erythrocin®, erythromycin

Pronunciation(mor I siz een)

U.S. Brand NamesEthmozine® [DSC]

Canadian Brand NamesEthmozine®

Pharmacologic CategoryAntiarrhythmic Agent, Class I

Use: Labeled IndicationsTreatment of ventricular tachycardia and life-threatening ventricular arrhythmias

Use: Unlabeled/InvestigationalPVCs, complete and nonsustained ventricular tachycardia, atrial arrhythmias

Dosing: Adults**Ventricular arrhythmias:** Oral: 200-300 mg every 8 hours, adjust dosage at 150 mg/day at 3-day intervals. See table for dosage recommendations of transferring from other antiarrhythmic agents to Ethmozine®. Hospitalization required to start therapy.

Moricizine

Transferred From	**Start Ethmozine®**
Encainide, propafenone, tocainide, or mexiletine	8-12 hours after last dose
Flecainide	12-24 hours after last dose
Procainamide	3-6 hours after last dose
Quinidine, disopyramide	6-12 hours after last dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentStart at 600 mg/day or less.

Dosing: Hepatic ImpairmentStart at 600 mg/day or less.

Dietary ConsiderationsBest if taken on an empty stomach.

ContraindicationsHypersensitivity to moricizine or any component of the formulation; pre-existing second- or third-degree AV block (except in patients with a functioning artificial pacemaker); right bundle branch block when associated with left hemiblock or bifascicular block (unless functional pacemaker in place); cardiogenic shock

Warnings/Precautions

Boxed warnings:

- CAST II Trial: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Conduction disturbances: Dose-related increases in PR and QRS intervals occur.

Disease-related concerns:

- Cardiovascular disease: Avoid use in patients with CAD, previous history of MI, HF, pre-existing conduction abnormalities, and cardiomegaly.

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.

- Hepatic impairment: Use with caution in patients with significant hepatic impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- CAST II Trial: **[U.S. Boxed Warning]: The CAST II trial demonstrated a decreased trend in survival for patients receiving moricizine.**

Geriatric ConsiderationsDue to moricizine binding to plasma albumin and alpha-glycoprotein, other highly bound drugs may displace moricizine. Since elderly may require multiple drugs, caution with highly bound drugs is necessary. Consider changes in renal and hepatic function with age and monitor closely since half-life may be prolonged.

Pregnancy Risk FactorB

LactationEnters breast milk/not recommended

Adverse Reactions

>10%: Central nervous system: Dizziness

1% to 10%:

- Cardiovascular: Proarrhythmia, palpitation, cardiac death, ECG abnormalities, CHF
- Central nervous system: Headache, fatigue, insomnia
- Endocrine & metabolic: Decreased libido
- Gastrointestinal: Nausea, diarrhea, ileus
- Ocular: Blurred vision, periorbital edema
- Respiratory: Dyspnea

<1% (Limited to important or life-threatening): Ventricular tachycardia, cardiac chest pain, hyper-/hypotension, syncope, supraventricular arrhythmia, MI, apnea

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Induces** CYP1A2 (weak), 3A4 (weak)

Drug Interactions

Cimetidine: May decrease the metabolism of Moricizine. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Theophylline Derivatives: Moricizine may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Moricizine peak serum concentrations may be decreased if taken with food.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor cardiac status. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy, when titrating dosage, and on a regular basis with long-term therapy. **Note:** Moricizine has a low toxic:therapeutic ratio and overdose may easily produce severe and life-threatening reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsElectrolytes (correct any imbalance) prior to beginning therapy

Patient EducationTake exactly as directed; do not take additional doses or discontinue without consulting prescriber. You will need regular cardiac checkups and blood tests while taking this medication. You may experience dizziness or visual changes (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or headaches, sleep disturbances, or decreased libido (usually temporary, if persistent consult prescriber). Report chest pain, palpitation, or erratic heartbeat; increased weight or swelling of hands or feet; blurred vision or facial swelling; acute diarrhea; changes in bowel or bladder patterns; or respiratory difficulty. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as hydrochloride:

- Ethmozine®: 200 mg, 250 mg, 300 mg [DSC]

Generic AvailableNo

ManufacturerRoberts Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Ethmozine)

- 200 mg (100): $123.66
- 250 mg (100): $147.94
- 300 mg (100): $167.83

Mechanism of ActionClass I antiarrhythmic agent; reduces the fast inward current carried by sodium ions, shortens Phase I and Phase II repolarization, resulting in decreased action potential duration and effective refractory period

Pharmacodynamics/Kinetics

Protein binding, plasma: 95%

Metabolism: Significant first-pass effect; some enterohepatic recycling

Bioavailability: 38%

Half-life elimination: Healthy volunteers: 3-4 hours; Cardiac disease: 6-13 hours

Excretion: Feces (56%); urine (39%)

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause sedation or insomnia; may rarely cause anxiety, confusion, amnesia

Mental Health: Effects on Psychiatric TreatmentUse caution with TCAs may produce QT prolongation

Cardiovascular ConsiderationsThis class Ic antiarrhythmic agent was associated with a trend toward increased mortality in the CAST trial and therefore should not be used in patients with cardiovascular disease. Although moricizine was effective in suppressing asymptomatic ventricular arrhythmias in patients after myocardial infarction, it was accompanied by increased mortality. Cardiotoxic arrhythmic effects of moricizine and other class Ic drugs should not be treated using Class Ia antiarrhythmics.

Anesthesia and Critical Care Concerns/Other ConsiderationsThis class Ic antiarrhythmic agent was associated with a trend toward increased mortality in the CAST trial and therefore should not be used in patients with cardiovascular disease. Cardiotoxic arrhythmic effects of moricizine and other Class Ic drugs should not be treated using class Ia antiarrhythmics.

Index TermsMoricizine Hydrochloride

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Morphine Tablets: Recall Due to Potential for Oversized Tablets - November 2008

Certain lots of generic morphine tablets have been recalled due to possibility of oversized tablets. Oversized tablets may contain up to twice the amount of the active ingredient which may result in serious or life-threatening effects.

For more information, including lots involved, please refer to the FDA MedWatch alert: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Ethex

Medication Safety Issues

Sound-alike/look-alike issues:

Morphine may be confused with HYDROmorphone

Morphine sulfate may be confused with magnesium sulfate

MS Contin® may be confused with Oxycontin®

MSO_4 and MS are error-prone abbreviations (mistaken as magnesium sulfate)

Avinza® may be confused with Evista®, Invanz®

Roxanol™ may be confused with OxyFast®, Roxicet™, Roxicodone®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Use care when prescribing and/or administering morphine solutions. These products are available in different concentrations. Always prescribe dosage in mg; **not** by volume (mL).

Use caution when selecting a morphine formulation for use in neurologic infusion pumps (eg, Medtronic delivery systems). The product should be appropriately labeled as "preservative-free" and suitable for intraspinal use via continuous infusion. In addition, the product should be formulated in a pH range that is compatible with the device operation specifications.

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

Pronunciation(MOR feen SUL fate)

U.S. Brand NamesAstramorph/PF™; Avinza®; DepoDur®; Duramorph®; Infumorph®; Kadian®; MS Contin®; Oramorph SR®; Roxanol™

Canadian Brand NamesDoloral; Kadian®; M-Eslon®; M.O.S.-SR®; M.O.S.-Sulfate®; M.O.S.® 10; M.O.S.® 20; M.O.S.® 30; Morphine HP®; Morphine LP® Epidural; MS Contin®; MS-IR®; Novo-Morphine SR; PMS-Morphine Sulfate SR; Ratio-Morphine; Ratio-Morphine SR; Statex®; Zomorph®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsRelief of moderate to severe acute and chronic pain; relief of pain of myocardial infarction; relief of dyspnea of acute left ventricular failure and pulmonary edema; preanesthetic medication

DepoDur®: Epidural (lumbar) single-dose management of surgical pain

Infumorph®: Used in continuous microinfusion devices for intrathecal or epidural administration in treatment of intractable chronic pain

Controlled, extended, or sustained release products: Only intended/indicated for use when repeated doses for an extended period of time are required. The 100 mg and 200 mg tablets or capsules of Kadian®, MS Contin®, and morphine sulfate controlled-release tablets and the 60 mg, 90 mg, and 120 mg capsules of Avinza® should only be used in opioid-tolerant patients.

Dosing: Adults**Note:** These are guidelines and do not represent the doses that may be required in all patients. Doses and dosage intervals should be titrated to pain relief/prevention.

Acute pain (moderate-to-severe):

Oral (immediate release formulations: Opiate-naive: Initial: 10 mg every 4 hours as needed; patients with prior opiate exposure may require higher initial doses: usual dosage range: 10-30 mg every 4 hours as needed

I.M., SubQ: **Note:** Repeated SubQ administration causes local tissue irritation, pain, and induration.

Initial: Opiate-naive: 5-10 mg every 4 hours as needed; patients with prior opiate exposure may require higher initial doses; usual dosage range: 5-20 mg every 4 hours as needed

Rectal: 10-20 mg every 3-4 hours

I.V.: Initial: Opiate-naive: 2.5-5 mg every 3-4 hours; patients with prior opiate exposure may require higher initial doses. **Note:** Repeated doses (up to every 5 minutes if needed) in small increments (eg, 1-4 mg) may be preferred to larger and less frequent doses.

Acute myocardial infarction, analgesia (ACC/AHA 2004 Guidelines): Initial management: 2-4 mg, give 2-8 mg every 5-15 minutes as needed

Critically-ill patients (unlabeled dose): 0.7-10 mg (based on 70 kg patient) **or** 0.01-0.15 mg/kg every 1-2 hours as needed. **Note:** More frequent dosing may be needed (eg, mechanically-ventilated patients).

I.V., SubQ continuous infusion: 0.8-10 mg/hour; usual range: Up to 80 mg/hour

Continuous infusion: Usual dosage range: 5-35 mg/hour (based on 70 kg patient) **or** 0.07-0.5 mg/kg/hour

Patient-controlled analgesia (PCA): (Opiate-naive: Consider lower end of dosing range):

Usual concentration: 1 mg/mL

Demand dose: Usual: 1 mg; range: 0.5-2.5 mg

Lockout interval: 5-10 minutes

*Intrathecal (I.T.):***Note:** Administer with extreme caution and in reduced dosage to geriatric or debilitated patients. I.T. dose is usually $^1/_{10}$ that of epidural dosage.

Opioid-naive: 0.2-1 mg/dose (may provide adequate relief for 24 hours); repeat doses are **not** recommended

Continuous microinfusion (Infumorph®): Initial: 0.2-1 mg/day

Opioid-tolerant: 1-10 mg/day

Continuous microinfusion (Infumorph®): Initial: 1-10 mg/day, titrate to effect; usual maximum is ~20 mg/day

Epidural: Pain management: **Note:** Administer with extreme caution and in reduced dosage to geriatric or debilitated patients. Vigilant monitoring is particularly important in these patients.

Single-dose (Astromorph/PF™, Duramorph®): Initial: 5 mg, if pain relief not achieved in 1 hour, careful administration of 1-2 mg at intervals sufficient to assess effectiveness may be given; maximum: 10 mg/24 hours

Infusion: Bolus dose: 1-6 mg; infusion rate: 0.1-0.2 mg/hour; maximum dose: 10 mg/24 hours

Continuous microinfusion (Infumorph®):

Opioid-naive: Initial: 0.2-1 mg/day

Opioid-tolerant: Initial: 1-10 mg/day, titrate to effect; usual maximum is ~20 mg/day

Surgical anesthesia: Epidural: Single-dose (extended release, DepoDur®): Lumbar epidural only; not recommended in patients <18 years of age:

Cesarean section: 10 mg (after clamping umbilical cord)

Lower abdominal/pelvic surgery: 10-15 mg

Major orthopedic surgery of lower extremity: 15 mg

For DepoDur®: To minimize the pharmacokinetic interaction resulting in higher peak serum concentrations of morphine, administer the test dose of the local anesthetic at least 15 minutes prior to DepoDur® administration. Use of DepoDur® with epidural local anesthetics has not been studied. Other medications should not be administered into the epidural space for at least 48 hours after administration of DepoDur®.

Note: Some patients may benefit from a 20 mg dose, however, the incidence of adverse effects may be increased.

Chronic pain: Note: Patients taking opioids chronically may become tolerant and require doses higher than the usual dosage range to maintain the desired effect. Tolerance can be managed by appropriate dose titration. There is no optimal or maximal dose for morphine in chronic pain. The appropriate dose is one that relieves pain throughout its dosing interval without causing unmanageable side effects.

Oral: Controlled-, extended-, or sustained-release formulations: A patient's morphine requirement should be established using prompt-release formulations. Conversion to long-acting products may be considered when chronic, continuous treatment is required. Higher dosages should be reserved for use only in opioid-tolerant patients.

Capsules, extended release (Avinza®): Daily dose administered once daily (for best results, administer at same time each day)

Capsules, sustained release (Kadian®): Daily dose administered once daily or in 2 divided doses daily (every 12 hours)

Tablets, controlled release (MS Contin®), sustained release (Oramorph SR®), or extended release: Daily dose divided and administered every 8 or every 12 hours

Dosing: ElderlyRefer to adult dosing. Use with caution; may require reduced dosage in the elderly and debilitated patients.
Dosing: Pediatric**Note:** These are guidelines and do not represent the doses that may be required in all patients. Doses and dosage intervals should be titrated to pain relief/prevention.

Acute pain (moderate-to-severe): Children >6 months and <50 kg:

Oral (prompt release): 0.15-0.2 mg/kg every 3-4 hours as needed

I.M., I.V.: 0.1-0.2 mg/kg every 3-4 hours as needed

I.V. infusion: Range: 10-60 mcg/kg/hour

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Children and Adults: Administer at 75% of normal dose

Cl_{cr} <10 mL/minute: Children and Adults: Administer at 50% of normal dose

Intermittent HD:

Children: Administer 50% of normal dose

Adults: No dosage adjustment necessary

Peritoneal dialysis: Children: Administer 50% of normal dose

CRRT: Children and Adults: Administer 75% of normal dose, titrate

Dosing: Hepatic ImpairmentUnchanged in mild liver disease; substantial extrahepatic metabolism may occur. Excessive sedation may occur in cirrhosis.
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Fentanyl Transdermal Conversion
- Opioid Agonist Conversion

Administration: I.V.When giving morphine I.V. push, it is best to first dilute in 4-5 mL of sterile water, and then to administer slowly (eg, 15 mg over 3-5 minutes).
Administration: I.V. DetailpH: 2.5-6.0
Administration: OralDo not crush controlled release drug product, swallow whole. Kadian® and Avinza® can be opened and sprinkled on applesauce; do not crush or chew the beads. Contents of Kadian® capsules may be opened and sprinkled over 10 mL water and flushed through prewetted 16F gastrostomy tube; do not administer Kadian® through nasogastric tube.
Administration: OtherUse preservative-free solutions for intrathecal or epidural use.

Epidural, extended release liposomal suspension (DepoDur®): Intended for lumbar administration only. Thoracic administration has not been studied. May be administered undiluted or diluted up to 5 mL total volume in preservative-free NS. Do not use an in-line filter during administration. Not for I.V., I.M., or intrathecal administration.

Resedation may occur following epidural administration; this may be delayed ≥48 hours in patients receiving extended-release (DepoDur®) injections.

Administration of an epidural test dose (lidocaine 1.5% and epinephrine 1:200,000) may affect the release of morphine from the liposomal preparation. Delaying the dose for an interval of at least 15 minutes following the test dose minimizes this pharmacokinetic interaction. Except for a test dose, other epidural local anesthetics or medications should not be administered epidurally before or after this product for a minimum of 48 hours.

Dietary ConsiderationsMorphine may cause GI upset; take with food if GI upset occurs. Be consistent when taking morphine with or without meals.
Storage

Capsule, sustained release (Avinza®, Kadian®): Store at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

Injection: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F); do not freeze. Protect from light. Degradation depends on pH and presence of oxygen; relatively stable in pH ≤4; darkening of solutions indicate degradation.

DepoDur®: Store under refrigeration at 2°C to 8°C (36°F to 46°F); keep vials in carton during refrigeration; do not freeze. Check freeze indicator before administration; do not administer if bulb is pink or purple. May store at room temperature for up to 30 days in sealed, unopened vials. Gently invert to suspend particles prior to removal from vial. Once vial is opened, use within 4 hours.

Oral solution: Store at controlled room temperature of 25°C (68°F to 77°F). Do not freeze.

Suppositories: Store at controlled room temperature 25°C (77°F). Protect from light.

Tablet, extended release: Store at controlled room temperature of 25°C (77°F).

Tablet, immediate release: Store at controlled room temperature of 25°C (77°F). Protect from moisture.

Reconstitution Usual concentration for continuous I.V. infusion: 0.1-1 mg/mL in D_5W. DepoDur® may be diluted in preservative-free NS to a volume of 5 mL.

Compatibility Stable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, NS; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Allopurinol, amifostine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, amsacrine, atenolol, atracurium, aztreonam, bumetanide, calcium chloride, cefamandole, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, epinephrine, erythromycin lactobionate, esmolol, etomidate, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, IL-2, insulin (regular), kanamycin, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, meropenem, methotrexate, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, nafcillin, nicardipine, nitroglycerin, norepinephrine, ondansetron, oxacillin, oxytocin, paclitaxel, pancuronium, penicillin G potassium, piperacillin, piperacillin/tazobactam, potassium chloride, propofol, propranolol, ranitidine, remifentanil, sodium bicarbonate, sodium nitroprusside, tacrolimus, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vecuronium, vinorelbine, vitamin B complex with C, warfarin, zidovudine. **Incompatible:** Alatrofloxacin, amphotericin B cholesteryl sulfate complex, cefepime, doxorubicin liposome, minocycline, sargramostim. **Variable (consult detailed reference):** Acyclovir, furosemide, thiopental, TPN.

Compatibility in syringe: Compatible: Atropine, bupivacaine, bupivacaine with clonidine, butorphanol, cimetidine, dimenhydrinate, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydroxyzine, hyoscine, ketamine, ketamine with lidocaine, metoclopramide, midazolam, milrinone, ondansetron, pentazocine, perphenazine, promazine, ranitidine, scopolamine. **Incompatible:** Meperidine, thiopental. **Variable (consult detailed reference):** Chlorpromazine, haloperidol, heparin, pentobarbital, prochlorperazine edisylate, promethazine.

Compatibility when admixed: Compatible: Alteplase, atracurium, baclofen, bupivacaine, dobutamine, fluconazole, furosemide, ketamine, meropenem, metoclopramide, ondansetron, succinylcholine, verapamil. **Incompatible:** Aminophylline, amobarbital, chlorothiazide, fluorouracil, heparin, meperidine, phenobarbital, phenytoin, sodium bicarbonate, thiopental.

DepoDur®: Do not mix with other medications.

Restrictions C-II

Contraindications **Note:** Some contraindications are product specific. For details, please see detailed product prescribing information.

Hypersensitivity to morphine sulfate or any component of the formulation; severe respiratory depression (without resuscitative equipment); acute or severe asthma; known or suspected paralytic ileus; sustained release products are not recommended with gastrointestinal obstruction or in acute/postoperative pain; pregnancy (prolonged use or high doses at term). Oral solutions contraindicated in patients with heart failure due to chronic lung disease, cardiac arrhythmias, head injuries, brain tumors, acute alcoholism, deliriums tremens, seizure disorders, Injectable solution contraindicated during labor when a premature birth is anticipated. Some products contraindicated in patients with head injuries or increased intracranial pressure. DepoDur® contraindicated in circulatory shock and upper airway obstruction. MS Contin® and Kadian® contraindicated in patients with hypercarbia. Some immediate release formulations (tablets and solution) contraindicated in post biliary tract surgery, suspected surgical abdomen, surgical anastomosis, MAO inhibitor use (concurrent or within 14 days), general CNS depression.

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Abuse/misuse/diversion: See “Other warnings/precautions” below.
- Avinza®: See “Dosage form specific issues” below.
- Duramorph®: See “Dosage form specific issues” below.
- Extended/sustained release products: See “Dosage form specific issues” below.
- Intrathecal: See “Other warnings/precautions” below.
- Highly concentrated oral solutions: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), circulatory shock, or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics). May cause orthostatic hypotension and syncope in ambulatory patients.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).
- Respiratory depression: May cause respiratory depression. Risk increased in elderly patients, debilitated patients, and patients with conditions associated with hypoxia or hypercapnia.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions. May worsen gastrointestinal ileus due to the effects on GI motility. Some dosage forms are contraindicated in patients with a paralytic ileus.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction and acute pancreatitis. Use may cause constriction of sphincter of Oddi diminishing biliary and pancreatic secretions. Some dosage forms are contraindicated in post biliary tract surgery.

- CNS depression/coma: Use with caution in patients with CNS depression or coma.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure (ICP); exaggerated elevation of ICP may occur. Some dosage forms are contraindicated with increased ICP or head trauma.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages. Some dosage forms may be contraindicated in patients with severe respiratory disorders.

- Seizure disorders: Use with caution in patients with seizure disorders, may cause seizures if high doses used.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs, CNS depressants, antihistamines, psychotropic drugs, or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Infants <3 months of age are more susceptible to respiratory depression; use with caution and generally in reduced doses in this age group.

Dosage form specific issues:

- Avinza®: **[U.S. Boxed Warning]: Do not administer with alcoholic beverages or ethanol-containing products, which may disrupt extended-release characteristic of product.**

- DepoDur®: **For lumbar administration only.** Intrathecal administration has resulted in prolonged respiratory depression. Freezing may adversely affect modified-release mechanism of drug; check freeze indicator within carton prior to administration.

- Duramorph®: **[U.S. Boxed Warning]: Due to the risk of severe and/or sustained cardiopulmonary depressant effects of Duramorph® it must be administered in a fully equipped and staffed environment.** Naloxone injection should be immediately available. Patient should remain in this environment for at least 24 hours following the initial dose.

- Extended/sustained release products: **[U.S. Boxed Warning]: Extended or sustained release dosage forms should not be crushed or chewed.** Controlled-, extended-, or sustained-release products are not intended for “as needed (PRN)” use. **MS Contin® 100 mg or 200 mg tablets and Kadian® 100 mg or 200 mg capsules are for use only in opioid-tolerant patients.** Avinza®, Kadian®, MS Contin®: **[U.S. Boxed Warning]: Indicated for the management of moderate-to-severe pain when around the clock pain control is needed for an extended time period.**

- Infumorph® solutions: **For use in microinfusion devices only**; not for I.V., I.M., or SubQ administration or for single-dose administration. Monitor closely, especially in the first 24 hours.

- Injections: Products are designed for administration by specific routes (I.V., intrathecal, epidural). Use caution when prescribing, dispensing, or administering to use formulations only by intended route(s).

- Sulfites: Some intravenous preparations contain sulfites which may cause allergic reactions in sulfite sensitive patients.

Other warnings/precautions:

- Abuse/misuse/diversion: Kadian®, MS Contin®: **[U.S. Boxed Warning]: Healthcare provider should be alert to problems of abuse, misuse, and diversion.**

- Epidural use: When used as an epidural injection, monitor for delayed sedation. Physician should evaluate patient for contraindications for epidural injection (eg, anticoagulant therapy, bleeding, diathesis, etc).

- Intrathecal: **[U.S. Boxed Warning]: Intrathecal dosage is usually $^{1}/_{10}$ that of epidural dosage.**

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics. For chronic administration of narcotic analgesics, morphine is preferable in the elderly due to its pharmacokinetics and side effect profile as compared to meperidine and methadone.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)

Pregnancy ConsiderationsMorphine crosses the placenta. The frequency of congenital malformations has not been reported to be greater than expected in children from mothers treated with morphine during pregnancy. Reduced growth and behavioral abnormalities in offspring have been observed in animal studies. Neonates born to mothers receiving chronic opioids during pregnancy should be monitored for neonatal withdrawal syndrome.

DepoDur® may be used in women undergoing cesarean section following clamping of the umbilical cord; not for use in vaginal labor and delivery.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsMorphine concentrates in breast milk, with a milk to plasma ratio of 2.5:1. Detectable serum levels of morphine can be found in infants following morphine administration to nursing mothers. Treatment of the mother with single doses of morphine is not expected to cause detrimental effects in nursing infants. Breast-feeding following chronic use or in neonates with hepatic or renal dysfunction may lead to higher levels of morphine in the infant and a risk of adverse effects. Some clinicians recommend administering morphine immediately after breast-feeding or 3-4 hours prior to the next feeding. Breast-feeding should be delayed for 48 hours after DepoDur® administration.

Adverse Reactions**Note:** Individual patient differences are unpredictable, and percentage may differ in acute pain (surgical) treatment. Reactions may be dose, formulation, and/or route dependent.

Frequency not defined:

Cardiovascular: Circulatory depression, flushing, shock

Central nervous system: Physical and psychological dependence, sedation

Endocrine & metabolic: Antidiuretic hormone release

>10%:

Cardiovascular: Bradycardia, hypotension

Central nervous system: Drowsiness (9% to 48%; tolerance usually develops to drowsiness with regular dosing for 1-2 weeks), dizziness (6% to 20%), fever (<3% to >10%), confusion, headache (following epidural or intrathecal use)

Dermatologic: Pruritus (may be dose related)

Gastrointestinal: Xerostomia (78%), constipation (9% to 40%; tolerance develops very slowly if at all), nausea (7% to 28%; tolerance usually develops to nausea and vomiting with chronic use), vomiting

Genitourinary: Urinary retention (16%; may be prolonged, up to 20 hours, following epidural or intrathecal use)

Hematologic: Anemia (following intrathecal use)

Local: Pain at injection site

Neuromuscular & skeletal: Weakness

Respiratory: Oxygen saturation decreased

Miscellaneous: Histamine release

1% to 10%:

Cardiovascular: Atrial fibrillation (<3%), chest pain (<3%), edema, hypertension, palpitation, peripheral edema, syncope, tachycardia, vasodilation

Central nervous system: Amnesia, agitation, anxiety, apathy, ataxia, chills, coma, delirium, depression, dream abnormalities, euphoria, false sense of well being, hallucination, hypoesthesia, insomnia, lethargy, malaise, nervousness, restlessness, seizure, slurred speech, somnolence, vertigo

Dermatologic: Dry skin, rash, urticaria

Endocrine & metabolic: Gynecomastia (<3%), hypokalemia, hyponatremia, libido decreased

Gastrointestinal: Abdominal distension, abdominal pain, anorexia, biliary colic, diarrhea, dyspepsia, dysphagia, flatulence, gastroenteritis, GERD, GI irritation, paralytic ileus, rectal disorder, taste perversion, weight loss

Genitourinary: Bladder spasm, dysuria, ejaculation abnormal, impotence, urination decreased

Hematologic: Leukopenia (<3%), thrombocytopenia (<3%), hematocrit decreased

Hepatic: Liver function tests increased

Neuromuscular & skeletal: Arthralgia, back pain, bone pain, foot drop, gait abnormalities, paresthesia, rigors, skeletal muscle rigidity, tremor

Ocular: Amblyopia, conjunctivitis, eye pain, vision problems/disturbance

Renal: Oliguria

Respiratory: Asthma, atelectasis, dyspnea, hiccups, hypercapnia, hypoxia, pulmonary edema (noncardiogenic), respiratory depression, rhinitis

Miscellaneous: Diaphoresis, flu-like syndrome, infection, thirst, voice alteration, withdrawal syndrome

<1%, postmarketing, and/or case reports: Amenorrhea, anaphylaxis, apnea, biliary tract spasm, blurred vision, bronchospasm, cardiac arrest, cough reflex decreased, dehydration, diplopia, disorientation, hemorrhagic urticaria, intestinal obstruction, intracranial pressure increased, laryngospasm, menstrual irregularities, miosis, myoclonus, nystagmus, paradoxical CNS stimulation, respiratory arrest, sepsis, urinary tract spasm, thermal dysregulation, toxic psychoses

Oncology: VesicantNo

Oncology: Emetic PotentialHigh (60% to 90%)

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Morphine Sulfate. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Trovafloxacin: Morphine Sulfate may decrease the serum concentration of Trovafloxacin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol, including alcoholic beverages or ethanol-containing products (may increase CNS depression).

Avinza®: Alcoholic beverages or ethanol-containing products may disrupt extended-release formulation resulting in rapid release of entire morphine dose.

Food: Administration of oral morphine solution with food may increase bioavailability (ie, a report of 34% increase in morphine AUC when morphine oral solution followed a high-fat meal). The bioavailability of Avinza®, Oramorph SR®, or Kadian® does not appear to be affected by food.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersPain relief, respiratory and mental status, blood pressure

Astromorph/PF™, Duramorph®, Infumorph®: Patients should be observed in a fully-equipped and staffed environment for at least 24 hours following initiation, and as appropriate for the first several days after catheter implantation.

DepoDur®: Patient should be monitored for at least 48 hours following administration.

Reference RangeTherapeutic: Surgical anesthesia: 65-80 ng/mL (SI: 227-280 nmol/L); Toxic: 200-5000 ng/mL (SI: 700-17,500 nmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor vital signs, respiratory and CNS status, therapeutic effectiveness, and adverse reactions or overdose at regular intervals with long-term use. May cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered), adverse reactions to report, and appropriate interventions to reduce side effects. Discontinue slowly after prolonged use.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Do not crush or chew controlled release tablet or capsule. May cause physical and/or psychological dependence. While using this medication, do not use alcohol (especially if using Avinza®) and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause itching, hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); loss of appetite, dry mouth, nausea, or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners and/or laxatives). Report chest pain, slow or rapid heartbeat, acute dizziness, or persistent headache; changes in mental status; swelling of extremities or unusual weight gain; changes in urinary elimination or pain on urination; acute headache; back or flank pain; muscle spasms; blurred vision; skin rash; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. If you are breast-feeding, consult prescriber.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product; [CAN] Canadian brand name

Capsule, extended release:

Avinza®: 30 mg, 60 mg, 90 mg, 120 mg

Kadian®: 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 100 mg, 200 mg

Infusion [premixed in D_5W]: 1 mg/mL (100 mL, 250 mL)

Injection, extended release liposomal suspension [lumbar epidural injection, preservative free]:

DepoDur®: 10 mg/mL (1 mL, 1.5 mL, 2 mL)

Injection, solution: 2 mg/mL (1 mL); 4 mg/mL (1 mL); 5 mg/mL (1 mL); 8 mg/mL (1 mL); 10 mg/0.7 mL (0.7 mL); 10 mg/mL (1 mL, 10 mL); 15 mg/mL (1 mL, 20 mL); 25 mg/mL (4 mL, 10 mL, 20 mL, 40 mL, 50 mL, 100 mL, 250 mL); 50 mg/mL (20 mL, 40 mL) [some preparations contain sodium metabisulfite]

Injection, solution [epidural, intrathecal, or I.V. infusion; preservative free]:

Astramorph/PF™: 0.5 mg/mL (2 mL, 10 mL); 1 mg/mL (2 mL, 10 mL)

Duramorph®: 0.5 mg/mL (10 mL); 1 mg/mL (10 mL)

Injection, solution [epidural or intrathecal infusion via microinfusion device; preservative free]:

Infumorph®: 10 mg/mL (20 mL); 25 mg/mL (20 mL)

Injection, solution [I.V. infusion via PCA pump]: 0.5 mg/mL (30 mL); 1 mg/mL (30 mL, 50 mL); 2 mg/mL (30 mL); 5 mg/mL (30 mL, 50 mL)

Injection, solution [preservative free]: 0.5 mg/mL (10 mL); 1 mg/mL (10 mL); 25 mg/mL (4 mL, 10 mL, 20 mL)

Solution, oral: 10 mg/5 mL (5 mL, 100 mL, 500 mL); 20 mg/5 mL (100 mL, 500 mL); 20 mg/mL (30 mL, 120 mL, 240 mL)

Doloral [CAN]: 1 mg/mL (10 mL, 250 mL, 500 mL); 5 mg/mL (10 mL, 250 mL, 500 mL) [not available in U.S.]

Solution, oral [concentrate]: 5 mg/0.25 mL (0.25 mL) [DSC]; 10 mg/0.5 mL (0.5 mL) [DSC]; 20 mg/mL (1 mL [DSC], 15 ml, 30 mL, 120 mL, 240 mL)

Roxanol™: 20 mg/mL (30 mL, 120 mL); 100 mg/5 mL (240 mL)

Suppository, rectal: 5 mg (12s), 10 mg (12s), 20 mg (12s), 30 mg (12s)

Tablet: 10 mg [DSC], 15 mg, 30 mg

Tablet, controlled release:

MS Contin®: 15 mg, 30 mg, 60 mg, 100 mg, 200 mg

Tablet, extended release: 15 mg, 30 mg, 60 mg, 100 mg, 200 mg

Tablet, sustained release:

Oramorph SR®: 15 mg, 30 mg, 60 mg, 100 mg

Generic AvailableYes: Excludes capsule, controlled release tablet, sustained release tablet, extended release liposomal suspension for injection

Mechanism of ActionBinds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression

Pharmacodynamics/Kinetics

Onset of action (patient dependent; dosing must be individualized): Oral (immediate release): ~30 minutes; I.V.: 5-10 minutes

Duration (patient dependent; dosing must be individualized): Pain relief:

Immediate release formulations: 4 hours

Extended release capsule and tablet: 8-24 hours (formulation dependent)

Extended release epidural injection (DepoDur®): >48 hours

Absorption: Variable

Distribution: V_d: 3-4 L/kg; binds to opioid receptors in the CNS and periphery (eg, GI tract)

Protein binding: 30% to 35%

Metabolism: Hepatic via conjugation with glucuronic acid primarily to morphine-6-glucoronide (active analgesic) morphine-3-glucuronide (inactive as analgesic); minor metabolites include morphine-3-6-diglucuronide; other minor metabolites include normorphine (active) and morphine 3-ethereal sulfate

Bioavailability: Oral: 17% to 33% (first-pass effect limits oral bioavailability; oral:parenteral effectiveness reportedly varies from 1:6 in opioid naive patients to 1:3 with chronic use)

Half-life elimination: Adults: 2-4 hours (immediate release forms)

Time to peak, plasma: Avinza®: 30 minutes (maintained for 24 hours); Kadian®: ~10 hours; Oramorph® SR: ~4 hours

Excretion: Urine (primarily as morphine-3-glucuronide, ~2% to 12% excreted unchanged); feces (~7% to 10%). It has been suggested that accumulation of morphine-6-glucuronide might cause toxicity with renal insufficiency. All of the metabolites (ie, morphine-3-glucuronide, morphine-6-glucuronide, and normorphine) have been suggested as possible causes of neurotoxicity (eg, myoclonus).

Related Information

- Narcotic / Opioid Analgesics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and dysphagia. Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause dysphoric reactions, toxic psychosis, dizziness, euphoria, anxiety, restlessness, confusion, and depression; may rarely cause insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause severe hypotension in patients receiving phenothiazines; monitor blood pressure. The depressant effects of morphine are potentiated by alcohol and psychotropic medications. Use of typical antipsychotics with neuraxial morphine may increase the risk of respiratory depression.

Cardiovascular ConsiderationsMorphine may be used for pain relief after myocardial infarction. It is important that the risk for respiratory depressant effects of morphine be considered. Morphine may cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

In the treatment of unstable angina/non-ST-segment elevation MI, morphine sulfate is recommended when symptoms are not relieved with nitroglycerin or when acute pulmonary edema and/or agitation are present, in the absence of contraindications. It should not be assumed that reperfusion has occurred if patient experiences resolution of chest discomfort after administration of any analgesic, including morphine.

Of concern are the results from the recent CRUSADE Quality Improvement Initiative (Meine TJ, 2005). In a nonrandomized, retrospective, observational registry that enrolls patients with non-ST segment elevation acute coronary syndrome (NSTE ACS) across the U.S., intravenous morphine was reviewed versus not and between patients treated with morphine versus intravenous nitroglycerin. A total of over 17,000 patients received morphine within 24 hours of presentation. Patients treated with morphine had a higher adjusted risk of death (CI 1.33-1.64) than patients not treated with morphine. Relative to those receiving nitroglycerin, patients treated with morphine also had a higher adjusted likelihood of death. This analysis raises questions about the safety of morphine administration in this group of patients. A well designed trial may be required to further evaluate this finding.

Anesthesia and Critical Care Concerns/Other ConsiderationsWhen developing a therapeutic plan for pain control, scheduled, intermittent opioid dosing or continuous infusion is preferred over the “as needed” regimen. The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) recommend fentanyl in patients who need immediate pain relief because of its rapid onset of action; fentanyl or hydromorphone is preferred in patients who are hypotensive or have renal dysfunction. Morphine or hydromorphone is recommended for intermittent, scheduled therapy. Both have a longer duration of action requiring less frequent administration. If the patient has required high-dose analgesia or has used for a prolonged period (~7 days), taper dose to prevent withdrawal; monitor for signs and symptoms of withdrawal. Use only preservative-free injections for epidural or intrathecal administration; less adverse effects are associated with epidural compared to intrathecal route of administration.

Morrhuate Sodium

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(MOR yoo ate SOW dee um)
U.S. Brand NamesScleromate®
Pharmacologic CategorySclerosing Agent
Use: Labeled IndicationsTreatment of small, uncomplicated varicose veins of the lower extremities
Dosing: Adults**Varicose veins:** I.V.: 50-250 mg, repeated at 5- to 7-day intervals (50-100 mg for small veins, 150-250 mg for large veins)
Dosing: ElderlyRefer to adult dosing.
Administration: I.V.Avoid extravasation. Use only clear solutions, solution should become clear when warmed.
StorageRefrigerate
ContraindicationsHypersensitivity to morrhuate sodium or any component of the formulation; arterial disease, thrombophlebitis
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Anaphylactoid and allergic reactions have occurred.
- Extravasation: Sloughing and necrosis of tissue may occur following extravasation.

Other warnings/precautions:

- Experienced physician: This drug should only be administered by a physician familiar with proper injection techniques.
- Test dose: A test dose of 0.25-5 mL of a 5% injection should be given 24 hours before full-dose treatment.

Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Thrombosis, valvular incompetency, vascular collapse

Central nervous system: Dizziness, drowsiness, headache

Dermatologic: Urticaria

Gastrointestinal: Nausea, vomiting

Local: Burning at the site of injection, severe extravasation effects

Neuromuscular & skeletal: Weakness

Respiratory: Asthma

Miscellaneous: Anaphylaxis, hypersensitivity reactions

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 50 mg/mL (30 mL)

Generic AvailableYes
Mechanism of ActionBoth varicose veins and esophageal varices are treated by the thrombotic action of morrhuate sodium. By causing inflammation of the vein's intima, a thrombus is formed. Occlusion secondary to the fibrous tissue and the thrombus results in the obliteration of the vein.
Pharmacodynamics/Kinetics

Onset of action: ~5 minutes

Absorption: Most stays at site of injection

Distribution: Esophageal varices treatment: ~20% of dose to lungs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported

Mouthwash

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(MOUTH wosh)
Pharmacologic CategoryAntimicrobial Mouth Rinse; Antiplaque Agent; Mouthwash
Use: DentalAid in prevention and reduction of plaque and gingivitis; halitosis
Dosing: Adults **Plaque/gingivitis prevention:** Oral: Rinse full strength for 30 seconds with 20 mL ($^2/_3$ fluid ounce or 4 teaspoonfuls) morning and night
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to any component of the formulation
Adverse ReactionsNo data reported
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Rinse: 250 mL, 500 mL, 1000 mL

Dental Health Professional ConsiderationsActive ingredients:

Listerine® Antiseptic: Thymol 0.064%, eucalyptus 0.092%, methyl salicylate 0.060%, menthol 0.042%, alcohol 26.9%, water, benzoic acid, poloxamer 407, sodium benzoate, caramel

Fresh Burst Listerine® Antiseptic: Thymol 0.064%, eucalyptus 0.092%, methyl salicylate 0.060%, menthol 0.042%, alcohol 26.9%, water, benzoic acid, poloxamer 407, sodium benzoate, flavoring, sodium, saccharin, sodium citrate, citric acid, D&C yellow #10, FD&C green #3

Cool Mint Listerine® Antiseptic: Thymol 0.064%, eucalyptus 0.092%, methyl salicylate 0.060%, menthol 0.042%, alcohol 26.9%, water, benzoic acid, poloxamer 407, sodium benzoate, flavoring, sodium, saccharin, sodium citrate, citric acid, FD&C green #3

The following information is endorsed on the label of the Listerine® products by the Council on Scientific Affairs, American Dental Association: "Listerine® Antiseptic has been shown to help prevent and reduce supragingival plaque accumulation and gingivitis when used in a conscientiously applied program of oral hygiene and regular professional care. Its effect on periodontitis has not been determined."

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsAntiseptic Mouthwash
International Brand NamesCorsodyl Mouthwash (PL)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

> Avelox® may be confused with Avonex®

International issues:

> Vigamox™ may be confused with Fisamox® which is a brand name for amoxicillin in Australia

Pronunciation(moxs i FLOKS a sin)

U.S. Brand NamesAvelox®; Avelox® I.V.; Vigamox™

Canadian Brand NamesAvelox®; Avelox® I.V.; Vigamox™

Pharmacologic CategoryAntibiotic, Ophthalmic; Antibiotic, Quinolone; Respiratory Fluoroquinolone

Use: Labeled IndicationsTreatment of mild-to-moderate community-acquired pneumonia, including multidrug-resistant *Streptococcus pneumoniae* (MDRSP); acute bacterial exacerbation of chronic bronchitis; acute bacterial sinusitis; complicated and uncomplicated skin and skin structure infections; complicated intra-abdominal infections; bacterial conjunctivitis (ophthalmic formulation)

Use: Unlabeled/Investigational*Legionella*

Dosing: Adults

Acute bacterial sinusitis: Oral, I.V.: 400 mg every 24 hours for 10 days

Bacterial conjunctivitis: Ophthalmic: Instill 1 drop into affected eye(s) 3 times/day for 7 days

Chronic bronchitis, acute bacterial exacerbation: Oral, I.V.: 400 mg every 24 hours for 5 days

Intra-abdominal infections, complicated: Oral, I.V.: 400 mg every 24 hours for 5-14 days (initiate with I.V.)

Pneumonia, community-acquired (including MDRSP): Oral, I.V.: 400 mg every 24 hours for 7-14 days

Skin and skin structure infections: Oral, I.V.:

> *Complicated:* 400 mg every 24 hours for 7-21 days
>
> *Uncomplicated:* 400 mg every 24 hours for 7 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricBacterial conjunctivitis: Ophthalmic: Children ≥1 year: Refer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary, including patients on hemodialysis, CRRT, or CAPD.

Dosing: Hepatic ImpairmentNo dosage adjustment is required in mild, moderate, or severe hepatic insufficiency (Child-Pugh class A, B, or C); however, use with caution in this patient population secondary to the risk of QT prolongation.

Administration: I.V.Infuse over 60 minutes; do not infuse by rapid or bolus intravenous infusion

Dietary ConsiderationsMay be taken with or without food. Take 4 hours before or 8 hours after multiple vitamins, antacids, or other products containing magnesium, aluminum, iron, or zinc.

Avelox® I.V. infusion (premixed in sodium chloride 0.8%) contains sodium 34.2 mEq (~787mg)/250 mL.

StorageStore at controlled room temperature of 25°C (77°F). Do not refrigerate infusion solution.

CompatibilityStable in NS, D$_5$W, D$_{10}$W, SWFI, LR; do not add other medications to intravenous solution.

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to moxifloxacin, other quinolone antibiotics, or any component of the formulation

Allergy Considerations

- Fluoroquinolone Allergy

Warnings/Precautions

Boxed Warnings:

> • Tendon inflammation/rupture: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Altered cardiac conduction: Fluoroquinolones may prolong QT_c interval; avoid use in patients with a history of QT_c prolongation, uncorrected hypokalemia, hypomagnesemia, or concurrent administration of other medications known to prolong the QT interval (including Class Ia and Class III antiarrhythmics, cisapride, erythromycin, antipsychotics, and tricyclic antidepressants).

- CNS stimulation: Tremor, restlessness, confusion, and very rarely hallucinations or seizures may occur; use with caution in patients with known or suspected CNS disorder. Discontinue in patients who experience significant CNS adverse effects (eg, dizziness, hallucinations, suicidal ideations or actions).

- Glucose regulation: Fluoroquinolones have been associated with the development of serious, and sometimes fatal, hypoglycemia. These events have occurred most often in elderly patients with diabetes, but have also been reported in patients without a prior history of diabetes. Prompt identification and treatment of hypoglycemia is essential. Individual quinolones may differ in their potential to cause this effect. It was most evident with gatifloxacin (no longer marketed as s systemic formulation). Hyperglycemia has also been associated with the use of fluoroquinolones. Patients should be monitored closely for signs/symptoms of disordered glucose regulation.

- Hypersensitivity reactions: Severe hypersensitivity reactions, including anaphylaxis, have occurred with quinolone therapy. The spectrum of these reactions can vary widely; reactions may present as typical allergic symptoms (eg, itching, urticaria, rash, edema) after a single dose, or may manifest as severe idiosyncratic dermatologic (eg, Stevens-Johnson, toxic epidermal necrolysis), vascular (eg, vasculitis), pulmonary (eg, pneumonitis), renal (eg, nephritis), hepatic (eg, hepatic failure or necrosis), and/or hematologic (eg, anemia, cytopenias) events, usually after multiple doses. Prompt discontinuation of drug should occur if skin rash or other symptoms arise.

- Peripheral neuropathy: The use of quinolones has been linked to peripheral neuropathy (rare); discontinue if symptoms of sensory or sensorimotor neuropathy occur.

- Photosensitivity: Avoid excessive sunlight and take precautions to limit exposure (eg, loose fitting clothing, sunscreen); may rarely cause moderate-to-severe phototoxicity reactions. Discontinue use if phototoxicity occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

- Tendon inflammation/rupture: **[U.S. Boxed Warning]: There have been reports of tendon inflammation and/or rupture with quinolone antibiotics; risk may be increased with concurrent corticosteroids, organ transplant recipients, and in patients >60 years of age.** Rupture of the Achilles tendon sometimes requiring surgical repair has been reported most frequently; but other tendon sites (eg, rotator cuff, biceps) have also been reported. Strenuous physical activity may be an independent risk factor for tendonitis. Discontinue at first sign of tendon inflammation or pain. Tendon rupture may occur even after discontinuation of therapy.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with significant bradycardia or acute myocardial ischemia.

- Diabetes: Use with caution in patients with diabetes mellitus; glucose regulation may be altered.

- Hepatic impairment: Use with caution in patients with mild, moderate, or severe hepatic impairment or liver cirrhosis; may increase the risk of QT prolongation.

- Myasthenia gravis: Some quinolones may exacerbate myasthenia gravis, use with caution (rare, potentially life-threatening weakness of respiratory muscles may occur).

- Renal impairment: Use with caution in patients with renal failure; may increase risk of tendon rupture.

- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may increase risk of tendon rupture.

- Seizures: Use with caution in individuals at risk of seizures (CNS disorders or concurrent therapy with medications which may lower seizure threshold). Potential for seizures, although very rare, may be increased with concomitant NSAID therapy.

Special populations:

- Elderly: Adverse effects (eg, tendon rupture, QT changes) may be increased in the elderly.

- G6PD deficiency: Hemolytic reactions may (rarely) occur with quinolone use in patients with latent or actual G6PD deficiency.

- Pediatrics: Safety and efficacy of systemically-administered moxifloxacin (oral, intravenous) have not been established in children.

Dosage form specific issues:

- Ophthalmic solution: Eye drops should not be injected subconjunctivally or introduced directly into the anterior chamber of the eye. Contact lenses should not be worn during therapy.

Geriatric ConsiderationsSee Warnings/Precautions regarding tendon rupture in patients >60 years of age. No dosage adjustments are required based on age. Assess patient's ability to self-administer eye drops.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in some animal studies; therefore, the manufacturer classifies moxifloxacin as pregnancy category C. Quinolone exposure during human pregnancy has been reported with other agents (see Ciprofloxacin, Ofloxacin, and Norfloxacin monographs). To date, no specific teratogenic effect or increased pregnancy risk has been identified; however, because of concerns of cartilage damage in immature animals exposed to quinolones and the limited moxifloxacin specific data, moxifloxacin should only be used during pregnancy if a safer option is not available.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if moxifloxacin is excreted into breast milk. Breast-feeding is not recommended by the manufacturer. Although there is no information on the use of moxifloxacin during breast-feeding, other quinolones are considered compatible. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Moxifloxacin in Pregnancy & Lactation

Adverse Reactions

Systemic:

2% to 10%:

Central nervous system: Dizziness (2%)

Endocrine & metabolic: Serum chloride increased (≥2%), serum ionized calcium increased (≥2%), serum glucose decreased (≥2%)

Gastrointestinal: Nausea (6%), diarrhea (5%), amylase decreased (≥2%)

Hematologic: Decreased serum levels of the following (≥2%): Basophils, eosinophils, hemoglobin, RBC, neutrophils; increased serum levels of the following (≥2%): MCH, neutrophils, WBC

Hepatic: Bilirubin decreased/increased (≥2%)

Renal: Serum albumin increased (≥2%)

Respiratory: PO_2 decreased (≥2%)

0.1% to <2%:

Cardiovascular: Cardiac arrhythmias, palpitation, QT_c prolongation, tachycardia, vasodilation

Central nervous system: Anxiety, headache, insomnia, malaise, nervousness, pain, somnolence, vertigo

Dermatologic: Pruritus, rash (maculopapular, purpuric, pustular), urticaria

Gastrointestinal: Abdominal pain, amylase increased, anorexia, constipation, dyspepsia, flatulence, glossitis, lactic dehydrogenase increased, stomatitis, taste perversion, vomiting, xerostomia

Genitourinary: Vaginal moniliasis, vaginitis

Hematologic: Eosinophilia, leukopenia, prothrombin time prolonged, increased INR, thrombocythemia

Hepatic: GGTP increased, liver function test abnormal

Local: Injection site reaction

Neuromuscular & skeletal: Arthralgia, myalgia, tremor, weakness

Respiratory: Pharyngitis, pneumonia, rhinitis, sinusitis

Miscellaneous: Allergic reaction, infection, diaphoresis, oral moniliasis

<0.1%, postmarketing, and/or case reports: Abnormal dreams, abnormal gait, agitation, amblyopia, amnesia, anaphylactic reaction, anaphylactic shock, anemia, angioedema, aphasia, arthritis, asthma, atrial fibrillation, back pain, *C. difficile*-positive diarrhea, chest pain, cholestasis, confusion, depersonalization, depression, dysphagia, dyspnea, ECG abnormalities, emotional lability, face edema, gastritis, hallucinations, hepatic failure, hepatitis, hyperglycemia, hyperlipidemia, hyper-/hypotension, hypertonia, hyperuricemia, hypoesthesia, incoordination, INR decreased, jaundice (cholestatic), laryngeal edema, leg pain, nightmares, paresthesia, parosmia, pelvic pain, peripheral edema, peripheral neuropathy, photosensitivity/toxicity, prothrombin time decreased, pseudomembranous colitis, psychotic reaction, renal dysfunction, renal failure, seizure, sleep disorder, speech disorder, Stevens-Johnson syndrome, supraventricular tachycardia, syncope, taste loss, tendonitis, tendon rupture, thinking abnormal, thrombocytopenia, thromboplastin decreased, tinnitus, tongue discoloration, toxic epidermal necrolysis, ventricular tachyarrhythmias (including torsade de pointes and cardiac arrest [usually in patients with concurrent, severe proarrhythmic conditions]), vision abnormalities

Additional reactions with **ophthalmic** preparation: 1% to 6%: Conjunctivitis, dry eye, ocular discomfort, ocular hyperemia, ocular pain, ocular pruritus, subconjunctival hemorrhage, tearing, visual acuity decreased

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics.

Risk C: Monitor therapy

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Absorption is not affected by administration with a high-fat meal or yogurt.

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersWBC, signs of infection

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient’s allergy history before initiating therapy. Use caution with known or suspected CNS disorders; myasthenia gravis; current or potential for QT prolongation; renal impairment; or diabetes. Assess potential for interactions with other pharmacological or herbal agents patient may be taking. See Administration for infusion specifics. Patient should be monitored closely; if an allergic reaction occurs (itching, urticaria, dyspnea or facial edema, loss of consciousness, tingling, cardiovascular collapse), drug should be discontinued immediately and prescriber notified. Evaluate results of laboratory tests, therapeutic effectiveness (resolution of infection), and adverse reactions (eg, hypersensitivity reactions [severe reactions, including anaphylaxis, have occurred with quinolone therapy], opportunistic infection, tendon rupture, persistent diarrhea [*C. difficile*-associated colitis can occur up to 2 months post treatment]) regularly during prolonged therapy. Teach patient proper use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsWBC

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. If administered by infusion: Report immediately any redness, swelling, or pain at infusion site; any swelling of mouth, lips, tongue, or throat; chest pain or tightness; respiratory difficulty; back pain; itching; skin rash; tingling; tendon pain; dizziness; abnormal thinking; or anxiety. May cause dizziness, lightheadedness, or confusion (use caution to avoid falls or injury); nausea or vomiting (request antiemetic from prescriber). Report any tendon pain, chest pain, palpitations, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Oral: Take exactly as directed with or without food. Do not take antacids 4 hours before or 8 hours after taking this medication. Do not miss a dose (take a missed dose as soon as possible, unless it is almost time for your next dose). Take entire prescription even if feeling better. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Consult prescriber before having any vaccinations. May cause nausea, vomiting, or taste perversion (small, frequent meals, good mouth care, chewing gum, or sucking hard candy may help); headache; dizziness; insomnia; or anxiety (use caution when driving or engaging in tasks requiring alertness until response to drug is known). If inflammation or tendon pain occurs or you experience signs of an allergic reaction (eg, itching, urticaria, respiratory difficulty, facial edema or difficulty swallowing, loss of consciousness, tingling, chest pain, palpitations), discontinue use and contact prescriber immediately. Report persistent GI disturbances; CNS changes (eg, excessive sleepiness, agitation, tremors); skin rash; vision changes; respiratory difficulty; signs of opportunistic infection (eg, sore throat, chills, fever, burning, itching on urination, vaginal discharge, white plaques in mouth); persistent diarrhea (especially if it lasts after completing prescription); or worsening of condition.

Ophthalmic: Wash hands before instilling solution. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution as directed. Do not touch tip of applicator or let tip of applicator touch eye. Do not wear contact lenses during therapy. Temporary stinging, blurred vision, or dry eyes may occur. Report persistent pain, burning, excessive tearing, decreased visual acuity, swelling, itching, or worsening of condition.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in sodium chloride 0.8%]:

Avelox® I.V.: 400 mg (250 mL) [contains sodium ~787mg (34.2 mEq)/250 mL]

Solution, ophthalmic:

Vigamox™: 0.5% (3 mL)

Tablet:

Avelox®: 400 mg

Avelox® ABC Pack [unit-dose pack]: 400 mg (5s)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Vigamox)

0.5% (3): $78.53

Tablets (Avelox)

400 mg (30): $372.14

Mechanism of ActionMoxifloxacin is a DNA gyrase inhibitor, and also inhibits topoisomerase IV. DNA gyrase (topoisomerase II) is an essential bacterial enzyme that maintains the superhelical structure of DNA. DNA gyrase is required for DNA replication and transcription, DNA repair, recombination, and transposition; inhibition is bactericidal.

Pharmacodynamics/Kinetics

Absorption: Well absorbed; not affected by high-fat meal or yogurt

Distribution: V_d: 1.7 to 2.7 L/kg; tissue concentrations often exceed plasma concentrations in respiratory tissues, alveolar macrophages, abdominal tissues/fluids, and sinus tissues

Protein binding: ~30% to 50%

Metabolism: Hepatic (~52% of dose) via glucuronide (~14%) and sulfate (~38%) conjugation

Bioavailability: ~90%

Half-life elimination: Single dose: Oral: 12-16 hours; I.V.: 8-15 hours

Excretion: Urine (as unchanged drug [20%] and glucuronide conjugates); feces (as unchanged drug [25%] and sulfate conjugates)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dry mouth, glossitis, stomatitis, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMoxifloxacin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia; may rarely produce abnormal thinking, agitation, anorexia, anxiety, asthenia, ataxia, confusion, depersonalization, depression, euphoria, hallucination, hostility, nervousness, panic attacks, paranoia, psychosis, sedation, somnolence, or stress

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone; may have potential to prolong QT interval; should avoid in patients with uncorrected hypokalemia, or concurrent administration of other medications known to prolong the QT interval (antipsychotics and tricyclic antidepressants)

Cardiovascular ConsiderationsMoxifloxacin causes a dose-dependent QT prolongation. Coadministration of moxifloxacin with other drugs that also prolong the QT interval or induce bradycardia (eg, beta-blockers, amiodarone) should be avoided. Careful consideration should be given in the use of moxifloxacin in patients with cardiovascular disease, particularly in those with conduction abnormalities.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Moxifloxacin causes a dose-dependent QT prolongation. Coadministration of moxifloxacin with other drugs that also prolong the QT interval or induce bradycardia (eg, beta-blockers, amiodarone) should be avoided. Careful consideration should be given in the use of moxifloxacin in patients with cardiovascular disease, in those with conduction abnormalities.

Mumps Virus Vaccine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(mumpz VYE rus vak SEEN)
U.S. Brand NamesMumpsvax®
Pharmacologic CategoryVaccine
Use: Labeled IndicationsMumps prophylaxis by promoting active immunity

Note: Trivalent measles-mumps-rubella (MMR) vaccine is the preferred agent for most children and many adults; persons born prior to 1957 are generally considered immune and need not be vaccinated

Dosing: Adults**Immunization:** SubQ: 0.5 mL as a single dose
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥12-15 months: Refer to adult dosing.
Administration: OtherFor SubQ administration in outer aspect of the upper arm using a 25G 5/8" needle.
StorageProduct is shipped at ≤10˚C (50˚F). Prior to reconstitution, vaccine must be stored at ≤2°C to 8˚C (36°F to 46˚F). Following reconstitution, use as soon as possible, but may be stored at 2°C to 8˚C (36°F to 46˚F) for up to 8 hours. Protect from light prior to and after reconstitution.
ReconstitutionReconstitute using entire contents of one vial of provided preservative free diluent.
Contraindications

Hypersensitivity to mumps vaccine or any component of the formulation, including gelatin; febrile respiratory illness or active febrile infection; immunosuppressant therapy; primary or acquired immunodeficiency states; blood dyscrasias, leukemia, lymphoma or other malignant neoplasm affecting bone marrow or lymphatic systems; untreated tuberculosis; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use. Use with caution in patients with hypersensitivity to eggs or neomycin; patients with history of anaphylactic reaction may be at increased risk of immediate-type hypersensitivity reaction.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).

- Thrombocytopenia: Use with caution in patients with thrombocytopenia and those who develop thrombocytopenia after first dose; thrombocytopenia may worsen.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination. May be used in asymptomatic children with HIV. Patients with a history of congenital or hereditary immunodeficiency should not receive immunization until immune competence is demonstrated. Patients with leukemia who are in remission and who have not received chemotherapy for at least 3 months may be vaccinated.

- Pediatrics: Safety and efficacy have not been established in children <12 months of age.

Geriatric ConsiderationsMost adults are immune to mumps and vaccination is not necessary for those born prior to 1957; elderly who have lived in isolated communities may have no immunity; for those who fail to demonstrate immunity by testing, vaccination would be desired if exposure is likely (travel to endemic area, etc); the trivalent MMR is preferred, however
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Rates of spontaneous abortion may be increased if mumps infection occurs during the first trimester. Although mumps vaccine virus can infect the placenta and fetus, there is not good evidence that it causes congenital malformations. Pregnancy should be avoided for 3 months following vaccination.
Lactation

Excretion in breast milk unknown/use caution

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined.

Cardiovascular: Syncope, vasculitis

Central nervous system: Encephalitis, febrile seizure, fever, Guillain-Barré syndrome, irritability

Dermatologic: Angioneurotic edema, erythema multiforme, purpura, Stevens-Johnson syndrome, urticaria

Endocrine & metabolic: Diabetes mellitus, parotitis

Gastrointestinal: Diarrhea, pancreatitis

Genitourinary: Orchitis

Hematologic: Leukocytosis, thrombocytopenia

Local: Burning/stinging at injection site, wheal and flare at injection site

Ocular: Conjunctivitis, ocular palsies, optic neuritis, papillitis, retrobulbar neuritis

Otic: Nerve deafness, otitis media

Respiratory: Bronchial spasm, cough, rhinitis

Miscellaneous: Anaphylaxis, anaphylactoid reactions, lymphadenopathy

Drug Interactions

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Test Interactions Temporary suppression of tuberculosis skin test

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Mumpsvax®: ≥20,000 TCID_{50} [contains albumin (human), bovine serum, chicken egg protein, gelatin, sorbitol, and sucrose (1.9 mg/vial)]

Generic Available No

Mechanism of Action Promotes active immunity to mumps virus by inducing specific antibodies.

Related Information

- Immunization Recommendations
- Skin Tests

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Acceptable presumptive evidence of immunity includes one of the following:

1. Documentation of adequate vaccination. Adequate vaccination for mumps is defined as 1 dose of a live mumps virus vaccine for preschool children and adults not at high risk; 2 doses of a live mumps virus vaccine for school-aged children and high-risk adults. Healthcare workers, international travelers, and students in institutions of higher learning are considered high-risk adults.

2. Laboratory evidence of immunity to mumps

3. Birth prior to 1957

4. Documentation of physician-diagnosed mumps

During a mumps outbreak, additional doses of a mumps virus vaccine may need to be considered. MMR vaccine is recommended; refer to Measles Mumps Rubella Vaccine (Combined) monograph. Minimum interval between doses is 28 days.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May rarely cause confusion

Mental Health: Effects on Psychiatric Treatment None reported

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Bactroban® may be confused with bacitracin, baclofen, Bactrim™

Pronunciation(myoo PEER oh sin)

U.S. Brand NamesBactroban®; Bactroban® Nasal; Centany™ [DSC]

Canadian Brand NamesBactroban®

Pharmacologic CategoryAntibiotic, Topical

Use: Labeled Indications

Intranasal: Eradication of nasal colonization with MRSA in adult patients and healthcare workers

Topical: Treatment of impetigo or secondary infected traumatic skin lesions due to *S. aureus* and *S. pyogenes*

Use: Unlabeled/InvestigationalIntranasal: Surgical prophylaxis to prevent wound infections

Dosing: Adults

Impetigo: Topical: Ointment: Apply to affected area 3 times/day; re-evaluate after 3-5 days if no clinical response

Secondary skin infections: Topical: Cream: Apply to affected area 3 times/day for 10 days; re-evaluate after 3-5 days if no clinical response

Elimination of MRSA colonization: Intranasal: Approximately one-half of the ointment from the single-use tube should be applied into one nostril and the other half into the other nostril twice daily for 5 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Eradication of nasal MRSA: Intranasal: Children ≥12 years: Refer to adult dosing.

Impetigo: Topical: Ointment: Children ≥2 months: Refer to adult dosing.

Secondary skin infections: Topical: Cream: Children ≥3 months: Refer to adult dosing.

Administration: Topical

Intranasal ointment: After application into nostrils, press sides of nose together and gently massage to spread ointment throughout the insides of the nostrils; discard tube after use

Topical cream, ointment: For external use only; area may be covered with gauze if desired

ContraindicationsHypersensitivity to mupirocin or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: If skin irritation occurs, discontinue use.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy of the nasal product have not been established in children <12 years of age.

Dosage form specific issues:

- Polyethylene glycol: Potentially toxic amounts of polyethylene glycol contained in some topical products may be absorbed percutaneously in patients with extensive burns or open wounds.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with eyes. Not for treatment of pressure sores.

Geriatric ConsiderationsNot for treatment of pressure sores.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, headache

Dermatologic: Cellulitis, dermatitis, dry skin, erythema, hives, pruritus, rash

Gastrointestinal: Abdominal pain, diarrhea, nausea, taste perversion, ulcerative stomatitis, xerostomia

Local: Burning, edema, pain, stinging, tenderness

Ocular: Blepharitis

Otic: Ear pain

Respiratory: Cough, pharyngitis, rhinitis, upper respiratory tract congestion

Miscellaneous: Secondary wound infection

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess for effectiveness of therapy and symptoms of infection. Assess knowledge/teach patient appropriate application and use and adverse symptoms to report.
Patient EducationFor external use only. Wash hands before and after application. Apply thin film over affected areas exactly as directed. Avoid getting in eyes. Report rash, persistent burning, stinging, swelling, itching, or pain. Contact prescriber if no improvement is seen in 3-5 days. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Note: Strength expressed as base

Cream, topical, as calcium:

Bactroban®: 2% (15 g, 30 g) [contains benzyl alcohol]

Ointment, intranasal, as calcium:

Bactroban® Nasal: 2% (1 g) [single-use tube]

Ointment, topical: 2% (0.9 g, 22 g)

Bactroban®: 2% (22 g) [contains polyethylene glycol]

Centany™: 2% (15 g) [DSC]

Generic AvailableYes: Topical ointment
Pricing: U.S. (www.drugstore.com)

Cream (Bactroban)

2% (15): $56.37

2% (30): $83.64

Ointment (Bactroban)

2% (22): $69.99

Ointment (Mupirocin)

2% (22): $34.99

Mechanism of ActionBinds to bacterial isoleucyl transfer-RNA synthetase resulting in the inhibition of protein synthesis
Pharmacodynamics/Kinetics

Absorption: Topical: Penetrates outer layers of skin; systemic absorption minimal through intact skin

Metabolism: Skin: 3% to monic acid (inactive)

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness

Mental Health: Effects on Psychiatric Treatment None reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(myoo roe MOE nab see dee three)

U.S. Brand NamesOrthoclone OKT® 3

Canadian Brand NamesOrthoclone OKT® 3

Pharmacologic CategoryImmunosuppressant Agent

Use: Labeled IndicationsTreatment of acute allograft rejection in renal transplant patients; treatment of acute hepatic, and kidney rejection episodes resistant to conventional treatment

Use: Unlabeled/InvestigationalTreatment of acute pancreas rejection episodes resistant to conventional treatment

Dosing: Adults**Treatment of acute allograft rejection or acute graft-versus-host disease:** I.V. (refer to individual protocols): 5 mg/day once daily for 10-14 days

Note: Suggested prevention/treatment of muromonab-CD3 first-dose effects (grouped by adverse reaction):

Severe pulmonary edema:

- Effective prevention or palliation: Clear chest x-ray within 24 hours preinjection; weight restriction to ≤3% gain over 7days preinjection
- Supportive treatment: Prompt intubation and oxygenation; 24 hours close observation

Fever, chills:

- Effective prevention or palliation: 15 mg/kg methylprednisolone sodium succinate 1 hour preinjection; fever reduction to <37.8°C (100°F) 1 hour preinjection; acetaminophen (1 g orally) and diphenhydramine(50 mg orally) 1 hour preinjection
- Supportive treatment: Cooling blanket; acetaminophen as needed

Respiratory effects:

- Effective prevention or palliation: 100 mg hydrocortisone sodium succinate 30 minutes postinjection
- Supportive treatment: Additional 100 mg hydrocortisone sodium succinate as needed for wheezing; if respiratory distress, give epinephrine 1:1000 (0.3 mL SubQ)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols.

Treatment of acute allograft rejection or acute graft-versus-host disease: I.V.

Children <30 kg: 2.5 mg/day once daily for 7-14 days

Children >30 kg: 5 mg/day once daily for 7-14 days

or

Children <12 years: 0.1 mg/kg/day once daily for 10-14 days

Children ≥12 years: Refer to adult dosing.

Note: Suggested prevention/treatment of muromonab-CD3 first-dose effects (grouped by adverse reaction): Refer to adult dosing.

Dosing: Renal ImpairmentRemoval by dialysis: Molecular size of OKT3 is 150,000 daltons. Not dialyzed by most standard dialyzers; however, may be dialyzed by high flux dialysis. OKT3 will be removed by plasmapheresis. Administer following dialysis treatments.

Administration: I.V.**Not for I.M. administration.** Give I.V. push over <1 minute at a final concentration of 1 mg/mL. Methylprednisolone sodium succinate 1 mg/kg I.V. given prior to first muromonab-CD3 administration, and I.V. hydrocortisone sodium succinate 50-100 mg, given 30 minutes after administration are strongly recommended to decrease the incidence of reactions to the first dose.

Administration: I.V. DetailFilter each dose through a low protein-binding 0.22 micron filter (Millex GV) before administration. Patient temperature should not exceed 37.8°C (100°F) at time of administration.

Dietary ConsiderationsInjection solution contains sodium 43 mg/5 mL.

StorageRefrigerate; do not freeze. Do not shake. Stable in Becton Dickinson syringe for 16 hours at room temperature or refrigeration.

ContraindicationsHypersensitivity to OKT3 or any murine product; patients with uncompensated heart failure or uncontrolled hypertension, in fluid overload or those with >3% weight gain within 1 week prior to start of OKT3; mouse antibody titers >1:1000; history of seizures; known or suspected pregnancy; breast-feeding

Warnings/Precautions

Boxed warnings:

- Anaphylactic/anaphylactoid reactions: See "Concerns related to adverse effects" below.

- Experienced physician: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Anaphylactic/anaphylactoid reactions: **[U.S. Boxed Warning]: Anaphylactic and anaphylactoid reactions may occur after administration of any dose of muromonab-CD3;** acute hypersensitivity reactions may be characterized by cardiovascular collapse, cardiorespiratory arrest, loss of consciousness, shock, tachycardia, tingling, angioedema, airway obstruction, bronchospasm, dyspnea, urticaria, and pruritus. These reactions may be difficult to differentiate from the cytokine release syndrome associated with use; however, hypersensitivity reactions are more likely to occur within the first 10 minutes after administration.

- Central nervous system events: Seizures, encephalopathy, cerebral edema, aseptic meningitis, and headache have been reported following muromonab-CD3. Contraindicated for use in patients with a history of seizures or those who are predisposed to seizures.

- Cytokine release syndrome (CRS): May occur in a significant proportion of patients following the first couple of doses of muromonab-CD3; symptoms usually begin 30-60 minutes after administration of dose and may persist for several hours; symptoms range from a mild, self-limiting "flu-like reaction" to severe, life-threatening shock-like reaction. Signs and symptoms of CRS are characterized by pyrexia, chills, dyspnea, nausea, vomiting, chest pain, diarrhea, tremor, wheezing, headache, tachycardia, rigor, hypertension, pulmonary edema, and/or other cardiorespiratory manifestations. Patients at higher risk for serious complications include those with unstable angina, recent MI or ischemic heart disease, heart failure, pulmonary edema, COPD, intravascular volume overload or depletion, cerebrovascular disease, patients with advanced symptomatic vascular disease or neuropathy, history of seizures, and septic shock. Pretreatment with corticosteroids may decrease serum levels of cytokines and manifestations of the syndrome, but it is not known if this decreases organ damage and sequelae associated with it. Frequency and severity of this syndrome usually decreases with subsequent doses.

- Immunosuppression: May result in an increased susceptibility to infection.

- Lymphoproliferative disorders: Risk of development of lymphoproliferative disorders (particularly of the skin) is increased. Patients should be monitored appropriately, instructed to limit exposure to sunlight/UV light, and given supportive treatment should these conditions occur.

- Pulmonary edema: Severe pulmonary edema has occurred in patients with fluid overload.

- Thrombosis: Arterial, venous, and capillary thrombosis of allografts and other vascular beds have been reported with use; use with caution in patients with history of thrombosis or underlying vascular disease.

Disease-related concerns:

- Fever: If the patient's temperature is >37.8°C, reduce before administering OKT3.

Concurrent drug therapy issues:

- Other immunosuppressants: May result in an increased susceptibility to infection; dosage of concomitant immunosuppressants should be reduced during OKT3 therapy; cyclosporine should be decreased to 50% usual maintenance dose and maintenance therapy resumed about 4 days before stopping OKT3.

Others warnings/precautions:

- Appropriate use: It is imperative, especially prior to the first few doses, that there be no clinical evidence of volume overload, uncontrolled hypertension, or uncompensated heart failure, including a clear chest x-ray and weight restriction of ≤3% above the patient's minimum weight during the week prior to injection.

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of a physician experienced in immunosuppressive therapy in a facility appropriate for monitoring and resuscitation.** Cardiopulmonary resuscitation may be needed.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions**Note:** Signs and symptoms of cytokine release syndrome (characterized by pyrexia, chills, dyspnea, nausea, vomiting, chest pain, diarrhea, tremor, wheezing, headache, tachycardia, rigor, hypertension, pulmonary edema and/or other cardiorespiratory manifestations) occurs in a significant proportion of patients following the first couple of doses of muromonab-CD3. See Warnings/Precautions. Additionally, some patients have experienced immediate hypersensitivity reactions to muromonab-CD3 (characterized by cardiovascular collapse, cardiorespiratory arrest, loss of consciousness, hypotension/shock, tachycardia, tingling, angioedema (including laryngeal, pharyngeal, or facial edema), airway obstruction, bronchospasm, dyspnea, urticaria, and/or pruritus) upon initial exposure and re-exposure.

>10%:

Cardiovascular: Tachycardia (26%), hypotension (25%), hypertension (19%), edema (12%)

Central nervous system: Pyrexia (77%), chills (43%), headache (28%)

Otic: Tinnitus (1%)

Renal: Renal dysfunction (3%)

Respiratory: Abnormal chest sound (10%), hyperventilation (7%), wheezing (6%), respiratory congestion (4%), pulmonary edema (2%), hypoxia (1%), pneumonia (1%)

Miscellaneous: Diaphoresis (7%), infections (various)

<1%: ALT increased, AST increased, angina, anuria, apnea, cardiac arrest, coagulation disorder, coma, conjunctivitis, encephalopathy, epilepsy, GI hemorrhage, hallucinations, hearing decreased, heart failure, hepatitis, hypotonia, lymphadenopathy, lymphopenia, MI, mood changes, neoplasms (various), oliguria, paranoia, pneumonitis, psychosis, shock, thrombosis

Oncology: VesicantNo
Oncology: Emetic PotentialModerate (30% to 60%)
Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersChest x-ray, weight gain, CBC with differential, temperature, vital signs (blood pressure, temperature, pulse, respiration); immunologic monitoring of T cells, serum levels of OKT3
Reference Range

OKT3serum concentrations:

Serum level monitoring should be performed in conjunction with lymphocyte subset determinations; Trough concentration sampling best correlates with clinical outcome. Serial monitoring may provide a better early indicator of inadequate dosing during induction or rejection.

Mean serum trough levels rise during the first 3 days, then average 0.9 mcg/mL on days 3-14

Circulating levels ≥0.8 mcg/mL block the function of cytotoxic T cells *in vitro* and *in vivo*

Several recent analysis have suggested appropriate dosage adjustments of OKT3 induction course are better determined with OKT3 serum levels versus lymphocyte subset determination; however, no prospective controlled trials have been performed to validate the equivalency of these tests in predicting clinical outcome.

Lymphocyte subset monitoring: CD3+ cells: Trough sample measurement is preferable and reagent utilized defines reference range.

OKT3-FITC: <10-50 cells/mm^3 or <3% to 5%

CD3(IgG1)-FITC: similar to OKT3-FITC

Leu-4a: Higher number of CD3+ cells appears acceptable

Dosage adjustments should be made in conjunction with clinical response and based upon trends over several consecutive days

Nursing: Physical Assessment/MonitoringMonitor pretreatment laboratory results prior to beginning therapy. Monitor closely for acute adverse pulmonary and cardiac effects, and anaphylactic-type effects during and for 24 hours following first infusion. Monitor vital signs, cardiac status, respiratory status, and adverse reactions on a regular basis. Assess knowledge/instruct patient about adverse reactions to report (eg, opportunistic infection) and appropriate interventions to reduce side effects.
Monitoring: Lab TestsChest x-ray, CBC with differential, immunologic monitoring of T cells, serum levels of OKT3
Patient EducationThere may be a severe reaction to the first infusion of this medication. You may experience high fever, chills, respiratory difficulty, or congestion. You will be closely monitored and comfort measures provided. Effects are substantially reduced with subsequent infusions. During the period of therapy and for some time after the regimen of infusions you will be susceptible to infection. People may wear masks and gloves while caring for you to protect you as much as possible from infection (avoid crowds and exposure to infection). You may

experience dizziness, faintness, or trembling (use caution until response to medication is known); nausea or vomiting (small frequent meals, frequent mouth care); or sensitivity to direct sunlight (wear dark glasses, and protective clothing, use sunscreen, or avoid exposure to direct sunlight); headache, fever, chills, rash, and diarrhea. Report chest pain or tightness; symptoms of respiratory infection, wheezing, or respiratory difficulty; vision change; swelling of the extremities; sudden weight gain (>3-5 lbs/week); or muscular trembling. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 1 mg/mL (5 mL) [contains sodium 43 mg/5 mL]

Generic AvailableNo

ManufacturerOrtho Biotech, Inc

Mechanism of ActionReverses graft rejection by binding to T cells and interfering with their function by binding T-cell receptor-associated CD3 glycoprotein

Pharmacodynamics/Kinetics

Duration: 7 days after discontinuation

Time to peak: Steady-state: Trough: 3-14 days

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Mycophenolate Mofetil (CellCept®) and Mycophenolic Acid (Myfortic®): Association with Progressive Multifocal Leukoencephalopathy (PML) - June 2008

These product labeling changes have been incorporated into the mycophenolate Lexi-Comp monograph.

The FDA MedWatch alert can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#mycophenolate

Mycophenolate Mofetil (CellCept®) and Mycophenolic Acid (Myfortic®): Healthcare Professional Information Sheet Issued Regarding Fetal Risk Associated With Use - May 2008

The U.S. Food and Drug Administration (FDA) is reminding healthcare professionals of reports of spontaneous abortions and structural abnormalities (including microtia) occurring following exposure to mycophenolate during pregnancy. Product labeling for both mycophenolate mofetil (CellCept®) and mycophenolic acid (Myfortic®) was updated in November 2007 to reflect these fetal risks and include a change from pregnancy category C to category D.

The FDA has issued a Healthcare Professional Information Sheet with recommendations for clinicians prescribing mycophenolate mofetil (MMF) or mycophenolic acid (MPA) to women of childbearing potential. Clinicians should provide information to women concerning the fetal risks prior to patients receiving therapy and counsel women on the proper use of contraceptives. Clinicians should confirm that women are not pregnant by verifying a negative blood or urine pregnancy test (sensitivity at least 25 mIU/mL) within one week prior to beginning therapy. Woman of childbearing potential must use two reliable forms of effective contraception initiated 4 weeks prior to beginning treatment and continue for 6 weeks after the last dose of MMF or MPA. Women may also choose abstinence as their only form of birth control. Women who choose oral contraceptives as one of their methods should be made aware that MMF and MPA may decrease the serum level of the hormones and reduce their efficacy.

Additional information, including a copy of the Information for Healthcare Professionals, is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#MMF

Pronunciation(mye koe FEN oh late)

U.S. Brand NamesCellCept®; Myfortic®

Canadian Brand NamesCellCept®; Myfortic®

Pharmacologic CategoryImmunosuppressant Agent

Use: Labeled IndicationsProphylaxis of organ rejection concomitantly with cyclosporine and corticosteroids in patients receiving allogeneic renal (CellCept®, Myfortic®), cardiac (CellCept®), or hepatic (CellCept®) transplants

Use: Unlabeled/InvestigationalTreatment of rejection in liver transplant patients unable to tolerate tacrolimus or cyclosporine due to neurotoxicity; mild rejection in heart transplant patients; treatment of moderate-severe psoriasis; treatment of proliferative lupus nephritis; treatment of myasthenia gravis; prevention and treatment of graft-versus-host disease (GVHD)

Dosing: Adults**Note:** May be used I.V. for up to 14 days; transition to oral therapy as soon as tolerated.

Renal transplant:

CellCept®:

Oral: 1 g twice daily. Doses >2 g/day are not recommended.

I.V.: 1 g twice daily

Myfortic®: Oral: 720 mg twice daily (1440 mg/day)

Cardiac transplantation:

Oral (CellCept®): 1.5 g twice daily

I.V. (CellCept®): 1.5 g twice daily

Hepatic transplantation:

Oral (CellCept®): 1.5 g twice daily

I.V. (CellCept®): 1 g twice daily

Myasthenia gravis (unlabeled use): Oral (CellCept®): 1 g twice daily (range 1-3 g/day)

Dosing: ElderlyDosage is the same as younger patients, however, dosing should be cautious due to possibility of increased hepatic, renal, or cardiac dysfunction. Elderly patients may be at an increased risk of certain infections, gastrointestinal hemorrhage, and pulmonary edema, as compared to younger patients.

Dosing: Pediatric

Renal transplant: Oral:

CellCept® suspension: 600 mg/m^2/dose twice daily; maximum dose: 1 g twice daily

Alternatively, may use solid dosage forms according to BSA as follows:

BSA 1.25-1.5 m^2: 750 mg capsule twice daily

BSA >1.5 m^2: 1 g capsule or tablet twice daily

Myfortic®: 400 mg/m^2/dose twice daily; maximum dose: 720 mg twice daily

BSA <1.19 m^2: Use of this formulation is not recommended

BSA 1.19-1.58 m^2: 540 mg twice daily (maximum: 1080 mg/day)

BSA >1.58 m^2: 720 mg twice daily (maximum: 1440 mg/day)

Dosing: Renal Impairment

Renal transplant: GFR <25 mL/minute in patients outside the immediate post-transplant period:

CellCept®: Doses of >1 g administered twice daily should be avoided; patients should also be carefully observed; no dose adjustments are needed in renal transplant patients experiencing delayed graft function postoperatively

Myfortic®: Cl_{cr} <25 mL/minute: Monitor carefully

Cardiac or liver transplant: No data available; mycophenolate may be used in cardiac or hepatic transplant patients with severe chronic renal impairment if the potential benefit outweighs the potential risk.

Hemodialysis: Not removed; supplemental dose is not necessary.

Peritoneal dialysis: Supplemental dose is not necessary.

Dosing: Hepatic ImpairmentNo dosage adjustment is recommended for renal patients with severe hepatic parenchymal disease; however, it is not currently known whether dosage adjustments are necessary for hepatic disease with other etiologies.

Dosing: Adjustment for ToxicityANC <1.3 x 10^3/µL: Dosing should be interrupted or the dose reduced, appropriate diagnostic tests performed and patients managed appropriately

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Intravenous solutions should be given over at least 2 hours. Do not administer intravenous solution by rapid or bolus injection.

Administration: I.V. Detail

Reconstituted solution: pH 2.4-4.1

Administration: OralOral dosage formulations (tablet, capsule, suspension) should be administered on an empty stomach to avoid variability in MPA absorption. The oral solution may be administered via a nasogastric tube (minimum 8 French, 1.7 mm interior diameter); oral suspension should not be mixed with other medications. Delayed release tablets should not be crushed, cut, or chewed.

Dietary ConsiderationsOral dosage formulations should be taken on an empty stomach to avoid variability in MPA absorption. However, in stable renal transplant patients, may be administered with food if necessary. Oral suspension contains 0.56 mg phenylalanine/mL; use caution if administered to patients with phenylketonuria.

Storage

Capsules: Store at room temperature of 15°C to 39°C (59°F to 86°F).

Tablets: Store at room temperature of 15°C to 39°C (59°F to 86°F). Protect from light.

Oral suspension: Store powder for oral suspension at room temperature of 15°C to 39°C (59°F to 86°F). Once reconstituted, the oral solution may be stored at room temperature or under refrigeration. Do not freeze. The mixed suspension is stable for 60 days.

Injection: Store intact vials at room temperature 15°C to 30°C (59°F to 86°F). Store solutions at 15°C to 30°C (59°F to 86°F). Begin infusion within 4 hours of reconstitution.

Reconstitution

Oral suspension: Should be constituted prior to dispensing to the patient and **not** mixed with any other medication. Add 47 mL of water to the bottle and shake well for ~1 minute. Add another 47 mL of water to the bottle and shake well for an additional minute. Final concentration is 200 mg/mL of mycophenolate mofetil.

I.V.: Reconstitute the contents of each vial with 14 mL of 5% dextrose injection; dilute the contents of a vial with 5% dextrose in water to a final concentration of 6 mg mycophenolate mofetil per mL. **Note:** Vial is vacuum-sealed; if a lack of vacuum is noted during preparation, the vial should not be used.

CompatibilityStable in D_5W.

ContraindicationsHypersensitivity to mycophenolate mofetil, mycophenolic acid, mycophenolate sodium, or any component of the formulation; intravenous formulation is contraindicated in patients who are allergic to polysorbate 80

Warnings/Precautions

Boxed warnings:

- Experienced physician: See "Other warnings/precautions" below.
- Infection: See "Concerns related to adverse effects" below.
- Lymphoproliferative disorders: See "Concerns related to adverse effects" below.
- Pregnancy: See "Special populations" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal. Because mycophenolate mofetil has demonstrated teratogenic effects in rats and rabbits, tablets should not be crushed, and capsules should not be opened or crushed. Avoid inhalation or direct contact with skin or mucous membranes of the powder contained in the capsules and the powder for oral suspension. Caution should be exercised in the handling and preparation of solutions of intravenous mycophenolate. Avoid skin contact with the intravenous solution and reconstituted suspension. If such contact occurs, wash thoroughly with soap and water, rinse eyes with plain water.

Concerns related to adverse effects:

- Infection: **[U.S. Boxed Warning]: Risk for infection is increased.**
- Lymphoproliferative disorders: **[U.S. Boxed Warning]: Risk of development of lymphoma and skin malignancy is increased.** Patients should be monitored appropriately, instructed to limit exposure to sunlight/UV light, and given supportive treatment should these conditions occur.
- Neutropenia: Severe neutropenia may occur, requiring interruption of treatment (risk greater from day 31-180 post-transplant).
- Progressive multifocal leukoencephalopathy (PML): PML, a rare and potentially fatal condition affecting the CNS as a result of activation of the John Cunningham virus (JCV), has been reported. Symptoms of PML include apathy, ataxia, cognitive deficiencies, confusion, and hemiparesis. Risk factors for the development of PML include immunosuppression and treatment with immunosuppressant therapy. The onset of PML may warrant a reduction in immunosuppressive therapy; however, in transplant recipients, the risk of reduced immunosuppression and graft rejection should be considered.

Disease-related concerns:

- Hypoxanthine-guanine phosphoribosyltransferase deficiency: Theoretically, use should be avoided in patients with the rare hereditary deficiency of hypoxanthine-guanine phosphoribosyltransferase (such as Lesch-Nyhan or Kelley-Seegmiller syndrome).
- Peptic ulcer disease: Use with caution in patients with active peptic ulcer disease; may be associated with GI bleeding and/or perforation.
- Renal impairment: Use with caution in patients with renal impairment as toxicity may be increased; may require dosage adjustment in severe impairment.

Dosage form specific issues:

- Non-interchangeability of forms: **Note: CellCept® and Myfortic® dosage forms should not be used interchangeably due to differences in absorption.**
- Phenylalanine: Some dosage forms may contain phenylalanine.

Special populations:

- Pregnancy: **[U.S. Boxed Warning]: Mycophenolate is associated with an increased risk of congenital malformations and spontaneous abortions when used during pregnancy.** Females of childbearing potential should have a negative pregnancy test within 1 week prior to beginning therapy. Two reliable forms of contraception should be used beginning 4 weeks prior to, during, and for 6 weeks after therapy.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of a physician experienced in immunosuppressive therapy.**
- I.V. administration: Intravenous solutions should be given over at least 2 hours; **never** administer intravenous solution by rapid or bolus injection.

Pregnancy Risk FactorD

Pregnancy Considerations**[U.S. Boxed Warning]: Mycophenolate is associated with an increased risk of congenital malformations and spontaneous abortions when used during pregnancy.** Adverse events have been reported in animal studies at doses less than the equivalent recommended human dose. Data from the National Transplantation Pregnancy Registry (NTPR) have observed an increase in structural malformations (including ear malformations) in infants born to mothers taking mycophenolate during pregnancy. Spontaneous abortions have also been noted. Females of childbearing potential should have a negative pregnancy test within 1 week prior to beginning therapy. Two reliable forms of contraception should be used beginning 4 weeks prior to, during, and for 6 weeks after therapy. The effectiveness of hormonal contraceptive agents may be affected by mycophenolate.

The National Transplantation Pregnancy Registry (NTPR, Temple University) is a registry for pregnant women taking immunosuppressants following any solid organ transplant. The NTPR encourages reporting of all immunosuppressant exposures during pregnancy in transplant recipients at 877-955-6877.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is unknown if mycophenolate is excreted in human milk. Due to potentially serious adverse reactions, the decision to discontinue the drug or discontinue breast-feeding should be considered. Breast-feeding is not recommended during therapy or for 6 weeks after treatment is complete.

Adverse ReactionsAs reported in adults following oral dosing of CellCept® alone in renal, cardiac, and hepatic allograft rejection studies. In general, lower doses used in renal rejection patients had less adverse effects than higher doses. Rates of adverse effects were similar for each indication, except for those unique to the specific organ involved. The type of adverse effects observed in pediatric patients was similar to those seen in adults; abdominal pain, anemia, diarrhea, fever, hypertension, infection, pharyngitis, respiratory tract infection, sepsis, and vomiting were seen in higher proportion; lymphoproliferative disorder was the only type of malignancy observed. Percentages of adverse reactions were similar in studies comparing CellCept® to Myfortic® in patients following renal transplant.

>20%:

Cardiovascular: Hypertension (28% to 77%), hypotension (up to 33%), peripheral edema (27% to 64%), edema (27% to 28%), tachycardia (20% to 22%)

Central nervous system: Pain (31% to 76%), headache (16% to 54%), insomnia (41% to 52%), fever (21% to 52%), dizziness (up to 29%), anxiety (28%)

Dermatologic: Rash (up to 22%)

Endocrine & metabolic: Hyperglycemia (44% to 47%), hypercholesterolemia (41%), hypomagnesemia (up to 39%), hypokalemia (32% to 37%), hypocalcemia (up to 30%), hyperkalemia (up to 22%)

Gastrointestinal: Abdominal pain (25% to 62%), nausea (20% to 54%), diarrhea (31% to 52%), constipation (18% to 41%), vomiting (33% to 34%), anorexia (up to 25%), dyspepsia (22%)

Genitourinary: Urinary tract infection (37%)

Hematologic: Leukopenia (23% to 46%), hypochromic anemia (26% to 43%), leukocytosis (22% to 40%), thrombocytopenia (24% to 36%)

Hepatic: Liver function tests abnormal (up to 25%), ascites (24%)

Neuromuscular & skeletal: Back pain (35% to 47%), weakness (35% to 43%), tremor (24% to 34%), paresthesia (21%)

Renal: Creatinine increased (up to 39%), BUN increased (up to 35%)

Respiratory: Dyspnea (31% to 37%), respiratory tract infection (22% to 37%), cough (31%), lung disorder (22% to 30%)

Miscellaneous: Infection (18% to 27%), *Candida* (11% to 22%), herpes simplex (10% to 21%)

3% to <20%:

Cardiovascular: Angina, arrhythmia, arterial thrombosis, atrial fibrillation, atrial flutter, bradycardia, cardiac arrest, cardiac failure, CHF, extrasystole, facial edema, hypervolemia, pallor, palpitation, pericardial effusion, peripheral vascular disorder, postural hypotension, supraventricular extrasystoles, supraventricular tachycardia, syncope, thrombosis, vasodilation, vasospasm, venous pressure increased, ventricular extrasystole, ventricular tachycardia

Central nervous system: Agitation, chills with fever, confusion, convulsion, delirium, depression, emotional lability, hallucinations, hypoesthesia, malaise, nervousness, psychosis, somnolence, thinking abnormal, vertigo

Dermatologic: Acne, alopecia, bruising, cellulitis, hirsutism, petechia, pruritus, skin carcinoma, skin hypertrophy, skin ulcer, vesiculobullous rash

Endocrine & metabolic: Acidosis, Cushing's syndrome, dehydration, diabetes mellitus, gout, hypercalcemia, hyperlipemia, hyperphosphatemia, hyperuricemia, hypochloremia, hypoglycemia, hyponatremia, hypoproteinemia, hypothyroidism, parathyroid disorder, weight gain/loss

Gastrointestinal: Abdomen enlarged, dry mouth, dysphagia, esophagitis, flatulence, gastritis, gastroenteritis, gastrointestinal hemorrhage, gastrointestinal moniliasis, gingivitis, gum hyperplasia, ileus, melena, mouth ulceration, oral moniliasis, stomach disorder, stomatitis

Genitourinary: Impotence, nocturia, pelvic pain, prostatic disorder, scrotal edema, urinary frequency, urinary incontinence, urinary retention, urinary tract disorder

Hematologic: Coagulation disorder, hemorrhage, neutropenia, pancytopenia, polycythemia, prothrombin time increased, thromboplastin increased

Hepatic: Alkaline phosphatase increased, alkalosis, bilirubinemia, cholangitis, cholestatic jaundice, GGT increased, hepatitis, jaundice, liver damage, transaminases increased

Local: Abscess

Neuromuscular & skeletal: Arthralgia, hypertonia, joint disorder, leg cramps, myalgia, myasthenia, neck pain, neuropathy, osteoporosis

Ocular: Amblyopia, cataract, conjunctivitis, eye hemorrhage, lacrimation disorder, vision abnormal

Otic: Deafness, ear disorder, ear pain, tinnitus

Renal: Albuminuria, creatinine increased, dysuria, hematuria, hydronephrosis, kidney failure, kidney tubular necrosis, oliguria

Respiratory: Apnea, asthma, atelectasis, bronchitis, epistaxis, hemoptysis, hiccup, hyperventilation, hypoxia, respiratory acidosis, lung edema, pharyngitis, pleural effusion, pneumonia, pneumothorax, pulmonary hypertension, respiratory moniliasis, rhinitis, sinusitis, sputum increased, voice alteration

Miscellaneous: *Candida* (mucocutaneous 15% to 18%), CMV viremia/syndrome (12% to 14%), CMV tissue invasive disease (6% to 11%), herpes zoster cutaneous disease (4% to 10%), cyst, diaphoresis, flu-like syndrome, fungal dermatitis, healing abnormal, hernia, ileus infection, lactic dehydrogenase increased, peritonitis, pyelonephritis, thirst

Postmarketing and/or case reports: Atypical mycobacterial infection, colitis, gastrointestinal perforation, gastrointestinal ulcers, infectious endocarditis, interstitial lung disorder, intestinal villous atrophy, meningitis, pancreatitis, progressive multifocal leukoencephalopathy, pulmonary fibrosis (fatal), tuberculosis

Drug Interactions

Acyclovir-Valacyclovir: May increase the serum concentration of Mycophenolate. Mycophenolate may increase the serum concentration of Acyclovir-Valacyclovir. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Mycophenolate. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Cholestyramine Resin: May decrease the serum concentration of Mycophenolate. *Risk X: Avoid combination*

CycloSPORINE: May decrease the serum concentration of Mycophenolate. Specifically, cyclosporine may decrease concentrations of the active metabolite mycophenolic acid. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Ganciclovir-Valganciclovir: Mycophenolate may increase the serum concentration of Ganciclovir-Valganciclovir. Ganciclovir-Valganciclovir may increase the serum concentration of Mycophenolate. *Risk C: Monitor therapy*

Magnesium Salts: May decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

MetroNIDAZOLE: May decrease the serum concentration of Mycophenolate. Specifically, metronidazole may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Mycophenolate may decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Oral Contraceptive (Progestins): Mycophenolate may decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Mycophenolate. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Mycophenolate. Specifically, rifamycin derivatives may decrease the concentration of the active metabolite mycophenolic acid. *Risk X: Avoid combination*

Sevelamer: May decrease the serum concentration of Mycophenolate. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Decreases C_{max} of MPA by 40% following CellCept® administration and 33% following Myfortic® use; the extent of absorption is not changed

Herb/Nutraceutical: Avoid cat's claw, echinacea (have immunostimulant properties)

Monitoring ParametersComplete blood count; signs and symptoms of infection; pregnancy test (prior to initiation in females of childbearing potential)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions. Patient is at risk for lymphoproliferative disease and certain other malignancies, monitor closely. Monitor blood pressure periodically while receiving this medication. Assess for peripheral edema and other signs of fluid retention periodically. Patients with diabetes should monitor glucose levels closely (this medication may alter glucose levels). Monitor/instruct patient on appropriate interventions to reduce side effects, to monitor for signs of opportunistic infection, and adverse reactions to report.

Monitoring: Lab TestsRenal and liver function, CBC; pregnancy test (prior to initiation in females of childbearing potential)

Patient EducationTake oral formulations as directed, preferably 1 hour before or 2 hours after meals. Do not cut, chew, or crush delayed-release tablets. Do not take within 1 hour before or 2 hours after antacids or cholestyramine medications. Do not alter dose and do not discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) during entire course of therapy unless instructed to restrict fluid intake. You will be susceptible to infection (avoid crowds and exposure to infection). You may be at increased risk for skin cancer, wear protective clothing and use sunscreen with high protective factor to help limit exposure to sunlight and UV light. If you have diabetes, monitor glucose levels closely (drug may alter glucose levels). You may experience dizziness or trembling (use caution until response to medication is known); trouble sleeping; nausea or vomiting (small frequent meals, frequent mouth care may help); diarrhea (boiled milk, yogurt, or buttermilk may help); sores or white plaques in mouth (frequent rinsing of mouth and frequent mouth care may help); or muscle or back pain (mild analgesics may be recommended). Report chest pain; irregular heartbeat; acute headache or dizziness; swelling of extremities; unusual weight gain; symptoms of respiratory infection, cough, or respiratory difficulty; unresolved GI effects; fatigue, chills, fever unhealed sores, white plaques in mouth; irritation in genital area or unusual discharge; change in mental status, memory loss, loss of coordination or clumsiness, weakness in legs, difficulty speaking or understanding what others say; unusual bruising or bleeding; or other unusual effects related to this medication. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Two reliable forms of contraception should be used prior to, during, and for 6 weeks after therapy. The effectiveness of hormonal contraceptive agents may be reduced by mycophenolate. Consult prescriber if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as mofetil:

CellCept®: 250 mg

Injection, powder for reconstitution, as mofetil hydrochloride:

CellCept®: 500 mg [contains polysorbate 80]

Powder for oral suspension, as mofetil:

CellCept®: 200 mg/mL (225 mL) [provides 175 mL suspension following reconstitution; contains phenylalanine 0.56 mg/mL; mixed fruit flavor]

Tablet, as mofetil:

CellCept®: 500 mg [may contain ethyl alcohol]

Tablet, delayed release, as mycophenolic acid:

Myfortic®: 180 mg, 360 mg [formulated as a sodium salt]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (CellCept)

250 mg (30): $129.47

Suspension (reconstituted) (CellCept)

200 mg/mL (175): $676.94

Tablet, EC (Myfortic)

360 mg (120): $801.37

Tablets (CellCept)

500 mg (100): $787.64

Mechanism of ActionMPA exhibits a cytostatic effect on T and B lymphocytes. It is an inhibitor of inosine monophosphate dehydrogenase (IMPDH) which inhibits *de novo* guanosine nucleotide synthesis. T and B lymphocytes are dependent on this pathway for proliferation.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Correlation of toxicity or efficacy is still being developed, however, one study indicated that 12-hour AUCs >40 mcg/mL/hour were correlated with efficacy and decreased episodes of rejection

T_{max}: Oral: MPA:

CellCept®: 1-1.5 hours

Myfortic®: 1.5-2.5 hours

Absorption: AUC values for MPA are lower in the early post-transplant period versus later (>3 months) post-transplant period. The extent of absorption in pediatrics is similar to that seen in adults, although there was wide variability reported.

Oral: Myfortic®: 93%

Distribution:

CellCept®: MPA: Oral: 4 L/kg; I.V.: 3.6 L/kg

Myfortic®: MPA: Oral: 54 L (at steady state); 112 L (elimination phase)

Protein binding: MPA: 97%, MPAG 82%

Metabolism: Hepatic and via GI tract; CellCept® is completely hydrolyzed in the liver to mycophenolic acid (MPA; active metabolite); enterohepatic recirculation of MPA may occur; MPA is glucuronidated to MPAG (inactive metabolite)

Bioavailability: Oral: CellCept®: 94%; Myfortic®: 72%

Half-life elimination:

CellCept®: MPA: Oral: 18 hours; I.V.: 17 hours

Myfortic®: MPA: Oral: 8-16 hours; MPAG: 13-17 hours

Excretion:

CellCept®: MPA: Urine (<1%), feces (6%); MPAG: Urine (87%)

Myfortic®: MPA: Urine (3%), feces; MPAG: Urine (>60%)

- Antacid Drug Interactions
- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth ulceration, gum hyperplasia, gingivitis, dry mouth, dysphagia, oral moniliasis, and stomatitis.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness and insomnia are common
Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; avoid clozapine and carbamazepine
Cardiovascular ConsiderationsHypertension may accompany the use of mycophenolate in patients post-transplantation. Furthermore, this drug may also induce increases in cholesterol, increases in serum phosphate, hyperkalemia, and hyperglycemia.
Anesthesia and Critical Care Concerns/Other ConsiderationsAvoid inhalation or direct contact with skin or mucous membranes of the powder in CellCept® capsules. If such contact occurs, wash with soap and water; rinse eyes with plain water. Capsules should not be opened or crushed.

Hypertension may accompany the use of mycophenolate in patients post-transplantation. Furthermore, this drug may also induce increases in cholesterol and potassium, and impair glucose tolerance and phosphate and potassium depletion.

Nabilone

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(NA bi lone)
U.S. Brand NamesCesamet™
Canadian Brand NamesCesamet™
Pharmacologic CategoryAntiemetic
Use: Labeled IndicationsTreatment of refractory nausea and vomiting associated with cancer chemotherapy
Dosing: AdultsRefer to individual protocols.

Nausea and vomiting associated with cancer chemotherapy: Oral: 1-2 mg twice daily (maximum: 6 mg divided in 3 doses daily)

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to individual protocols.

Nausea and vomiting associated with cancer chemotherapy (unlabeled use): Oral: Children >4 years:

<18 kg: 0.5 mg twice daily

18-30 kg: 1 mg twice daily

>30 kg: 1 mg 3 times/day

Dosing: Renal ImpairmentNo adjustment required.
Administration: OralInitial dose should be given 1-3 hours before chemotherapy; may be given 2-3 times a day during the entire chemotherapy course and for up to 48 hours after the last dose of chemotherapy; a dose of 1-2 mg the night before chemotherapy may be useful.
StorageStore at room temperature between 15°C and 30°C (59°F and 86°F).
RestrictionsC-II
ContraindicationsHypersensitivity to nabilone, cannabinoids, tetrahydrocannabinol, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular effects: May cause tachycardia and/or orthostatic hypotension; use with caution in patients with cardiovascular disease.
- CNS depression: May impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists (drug is psychoactive substance in marijuana). Tolerance, psychological and physical dependence may occur with prolonged use.
- Psychiatric disorders: Use with caution in patients with mania, depression, or schizophrenia; cannabinoid use may reveal symptoms of psychiatric disorders. Careful psychiatric monitoring is recommended; psychiatric adverse reactions may persist for up to 3 days after discontinuing treatment.

Concurrent drug therapy issues:

- CNS depressants: Effects may be potentiated when used with other psychoactive drugs, sedatives and/or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may cause postural hypotension.
- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies did not demonstrate teratogenic effects; however, dose-related decreased fetal weights and increased fetal resorptions were observed. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsBecause some cannabinoids are excreted in breast milk, use in breast-feeding is not recommended.
Adverse Reactions

>10%:

Central nervous system: Dizziness (59%), drowsiness (52% to 66%), vertigo (52% to 59%), euphoria (11% to 38%), ataxia (13% to 14%), depression (14%), concentration decreased (12%), sleep disturbance (11%)

Gastrointestinal: Xerostomia (22% to 36%)

Ocular: Visual disturbance (13%)

1% to 10%:

Cardiovascular: Hypotension (8%)

Central nervous system: Dysphoria (9%), headache (6% to 7%), sedation (3%), depersonalization (2%), disorientation (2%)

Gastrointestinal: Anorexia (8%), nausea (4%), appetite increased (2%)

Neuromuscular & skeletal: Weakness (8%)

<1%, postmarketing, or frequency not reported: Abdominal pain, abnormal dreams, akathisia, allergic reaction, amblyopia, anemia, anhydrosis, anxiety, apathy, aphthous ulcer, arrhythmia, back pain, cerebral vascular accident, chest pain, chills, constipation, cough, diaphoresis, diarrhea, dyspepsia, dyspnea, dystonia, emotional disorder, emotional lability, epistaxis, equilibrium dysfunction, eye irritation, fatigue, fever, flushing, gastritis, hallucinations, hot flashes, hyperactivity, hypertension, infection, insomnia, irritation, joint pain, leukopenia, lightheadedness, malaise, memory disturbance, mood swings, mouth irritation, muscle pain, nasal congestion, neck pain, nervousness, neurosis (phobic), numbness, orthostatic hypotension, pain, palpitation, panic disorder, paranoia, paresthesia, perception disturbance, pharyngitis, photophobia, photosensitivity, polyuria, pruritus, psychosis (toxic), pupil dilation, rash, seizure, sinus headache, speech disorder, stupor, syncope, tachycardia, taste perversion, thirst, thought disorder, tinnitus, tremor, urination decreased, urinary retention, vomiting, wheezing, withdrawal, xerophthalmia

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergic Agents: May enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Cocaine: May enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Sympathomimetics: Cannabinoids may enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersBlood pressure, heart rate; signs and symptoms of excessive use, abuse, or misuse

Nursing: Physical Assessment/MonitoringFor use when other antiemetic agents have proved ineffective. Use caution with history of substance abuse or mental illness. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking that may cause additive CNS effects (eg, sedatives, hypnotics, psychoactive agents). Assess effectiveness of therapy and monitor closely for adverse psychotic reactions which may persist for up to 3 days following discontinuation; this drug has the psychoactive properties of marijuana and has the potential for abuse or dependence. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially sedatives or hypnotics). Take exactly as directed; do not increase dose or take more often than prescribed. Avoid alcohol. May cause psychotic reaction, impaired coordination or judgment, faintness, dizziness, drowsiness, unsteadiness, sleep disturbance or visual disturbances (do not drive or engage in activities that require alertness and coordination until response to drug is known); orthostatic hypotension (change position slowly and use caution when climbing stairs); dry mouth or decreased appetite (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report excessive or persistent CNS changes (euphoria, anxiety, depression, memory lapse, bizarre thought patterns, excitability, inability to control thoughts or behavior, fainting); respiratory difficulties; rapid heartbeat; or other adverse reactions.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Cesamet™: 1 mg

Generic AvailableNo

ManufacturerValeant Pharmaceuticals International

Mechanism of ActionNot fully characterized; antiemetic activity may be due to effect on cannabinoid receptors (CB1) within the central nervous system.

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: ~12.5 L/kg

Metabolism: To several active metabolites by oxidation and stereospecific enzyme reduction; CYP450 enzymes may also be involved

Half-life elimination: Parent compound: 2 hours; Metabolites: 35 hours

Time to peak, serum: Within 2 hours

Excretion: Feces (~60%); renal (~24%)

Mental Health: Effects on Mental StatusDizziness, drowsiness, and euphoria are common; may cause depression. May rarely cause confusion or hallucinations.

Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropic agents may produce additive CNS depression

Nabumetone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(na BYOO me tone)

Canadian Brand NamesApo-Nabumetone®; Gen-Nabumetone; Novo-Nabumetone; Relafen®; Rhoxal-nabumetone; Sandoz-Nabumetone

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsManagement of osteoarthritis and rheumatoid arthritis

Use: Unlabeled/InvestigationalModerate pain

Dosing: Adults**Osteoarthritis, rheumatoid arthritis:** Oral: 1000 mg/day; an additional 500-1000 mg may be needed in some patients to obtain more symptomatic relief; may be administered once or twice daily; maximum dose: 2000 mg/day

Note: Patients <50 kg are less likely to require doses >1000 mg/day.

Dosing: ElderlyRefer to adult dosing; do not exceed 2000 mg/day.

Dosing: Renal Impairment In general, NSAIDs are not recommended for use in patients with advanced renal disease, but the manufacturer of nabumetone does provide some guidelines for adjustment in renal dysfunction:

Moderate impairment (Cl_{cr} 30-49 mL/minute): Initial dose: 750 mg/day; maximum dose: 1500 mg/day

Severe impairment (Cl_{cr} <30 mL/minute): Initial dose: 500 mg/day; maximum dose: 1000 mg/day

Calculations

- Creatinine Clearance: Adults

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to nabumetone, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Photosensitivity reactions: May cause photosensitivity reactions.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsIn trials with nabumetone, no significant differences were noted between young and the elderly in regards to efficacy and safety. However, the elderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but the elderly may demonstrate these adverse effects at lower doses than younger adults.
Pregnancy Risk FactorC/D (3rd trimester)
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%: Gastrointestinal: Abdominal pain (12%), diarrhea (14%), dyspepsia (13%)

1% to 10%:

Cardiovascular: Edema (3% to 9%)

Central nervous system: Dizziness (3% to 9%), headache (3% to 9%), fatigue (1% to 3%), insomnia (1% to 3%), nervousness (1% to 3%), somnolence (1% to 3%)

Dermatologic: Pruritus (3% to 9%), rash (3% to 9%)

Gastrointestinal: Constipation (3% to 9%), flatulence (3% to 9%), guaiac positive (3% to 9%), nausea (3% to 9%), gastritis (1% to 3%), stomatitis (1% to 3%), vomiting (1% to 3%), xerostomia (1% to 3%)

Otic: Tinnitus

Miscellaneous: Diaphoresis (1% to 3%)

<1%: Abnormal vision, acne, agitation, albuminuria, alopecia, anemia, angina, angioneurotic edema, anorexia, anxiety, arrhythmia, asthma, azotemia, bilirubinemia duodenitis, bullous eruptions, chills, confusion, cough, depression, duodenal ulcer, dysphagia, dyspnea, dysuria, eructation, fever, gallstones, gastric ulcer, gastroenteritis, gingivitis, GI bleeding, glossitis, granulocytopenia, hematuria, hyperglycemia, hypertension, hypokalemia, impotence, jaundice, leukopenia, liver function abnormalities, malaise, melena, MI, nightmares, palpitation, pancreatitis, paresthesia, photosensitivity, pseudoporphyria cutanea tarda, rectal bleeding, renal stones, syncope, taste disorder, thrombophlebitis, tremor, urticaria, vasculitis, vertigo, weakness, weight gain/loss

Postmarketing and/or case reports: Anaphylactoid reaction, anaphylaxis, CHF, eosinophilic pneumonia, erythema multiforme, hepatic failure, hypersensitivity pneumonitis, hyperuricemia, interstitial nephritis, interstitial pneumonitis, nephrotic syndrome, renal failure, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Nabumetone peak serum concentrations may be increased if taken with food or dairy products.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersPatients with renal insufficiency: Baseline renal function followed by repeat test within weeks (to determine if renal function has deteriorated)

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, GI effects, hepatotoxicity, or ototoxicity) at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who develop eye complaints during long-term NSAID therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsPatients with renal insufficiency: Baseline renal function followed by repeat test within weeks (to determine if renal function has deteriorated)

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting healthcare prescriber. You may experience drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent oral care, sucking lozenges, or chewing gum may help); fluid retention (weigh yourself weekly and report unusual [3-5 lb/week] weight gain). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen extremities; skin rash or itching; acute fatigue; or hearing changes (ringing in ears).
Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 500 mg, 750 mg

Relafen®: 500 mg, 750 mg [DSC]

Generic AvailableYes

ManufacturerSmithKline Beecham Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Nabumetone)

500 mg (60): $39.99

750 mg (60): $39.98

Tablets (Relafen)

750 mg (60): $137.70

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Several days

Distribution: Diffusion occurs readily into synovial fluid

V_d: 6MNA: 29-82 L

Protein binding: 6MNA: >99%

Metabolism: Prodrug, rapidly metabolized in the liver to an active metabolite [6-methoxy-2-naphthylacetic acid (6MNA)] and inactive metabolites; extensive first-pass effect

Half-life elimination: 6MNA: ~24 hours

Time to peak, serum: 6MNA: Oral: 2.5-4 hours; Synovial fluid: 4-12 hours

Excretion: 6MNA: Urine (80%) and feces (9%)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and stomatitis. NSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause insomnia, confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin’s inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Nadolol and Bendroflumethiazide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(NAY doe lol & ben droe floo meth EYE a zide)

U.S. Brand NamesCorzide®

Pharmacologic CategoryBeta Blocker, Nonselective; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension; combination product should not be used for initial therapy

Dosing: Adults**Treatment of hypertension:** Oral: Initial: Nadolol 40 mg and bendroflumethiazide 5 mg once daily. May increase dose to nadolol 80 mg and bendroflumethiazide 5 mg once daily if needed.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} >50 mL/minute/1.73 m^2: Administer dose every 24 hours

Cl_{cr} 31-50 mL/minute/1.73 m^2: Administer dose every 24-36 hours

Cl_{cr} 10-30 mL/minute/1.73 m^2: Administer dose every 24-48 hours

Cl_{cr} <10 mL/minute/1.73 m^2: Administer dose every 40-60 hours

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without meals.

StorageStore at room temperature; avoid excessive heat.

ContraindicationsHypersensitivity to bendroflumethiazide, sulfonamide-derived drugs, or any component of the formulation; bronchial asthma; sinus bradycardia; heart block greater than first degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; uncompensated cardiac failure; anuria

Allergy Considerations

- Beta-Blocker Allergy
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Abrupt withdrawal: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur with bendroflumethiazide.

- Photosensitivity: Photosensitization may occur.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating nadolol.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms (eg, diaphoresis, tachycardia). May also reduce insulin secretion in response to hyperglycemia; adjustment of antidiabetic drugs may be necessary.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by bendroflumethiazide.

- Heart failure (HF): Use nadolol with caution in patients with compensated heart failure and monitor for a worsening of the condition. Cardiac failure has occurred in patients without prior history; monitor.

- Hepatic impairment: Use bendroflumethiazide with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypokalemia: Use bendroflumethiazide with caution in patients with hypokalemia; correct before initiating.

- Myasthenia gravis: Use nadolol with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): May precipitate or aggravate symptoms of arterial insufficiency in patients with PVD and Raynaud’s disease; use with caution and monitor for progression of arterial obstruction.

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use nadolol with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustments are required. May precipitate azotemia; discontinue or consider withholding if renal impairment occurs.

- Systemic lupus erythematosus (SLE): Bendroflumethiazide can cause SLE exacerbation or activation.

- Thyroid disease: May mask signs of hyperthyroidism (eg, tachycardia). If thyrotoxicosis is suspected, carefully manage and monitor; abrupt withdrawal may exacerbate symptoms of hyperthyroidism or precipitate thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use nadolol with caution in patients receiving anesthetic agents which decrease myocardial function.

- Calcium channel blockers: Use nadolol with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: **[U.S. Boxed Warning]: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.**

- Appropriate use: Used as a replacement for separate dosing of components or combination when response to single agent is suboptimal; the fixed combination is not indicated for initial treatment of hypertension.

Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Test InteractionsBendroflumethiazide may produce false negative results with phentolamine and tyramine; may interfere with phenolsulfonphthalein test; may cause diagnostic interference with electrolyte levels (serum), glucose (serum, urine), and decreased PBI (serum) levels without signs of thyroid disturbance.

Monitoring ParametersAssess weight, fluid status; blood pressure, heart rate; serum electrolytes, BUN, creatinine

Monitoring: Lab TestsSerum electrolytes, BUN, creatinine

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Nadolol 40 mg and bendroflumethiazide 5 mg; nadolol 80 mg and bendroflumethiazide 5 mg

Corzide® 40/5: Nadolol 40 mg and bendroflumethiazide 5 mg [scored]

Corzide® 80/5: Nadolol 80 mg and bendroflumethiazide 5 mg [scored]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Corzide)

40-5 mg (30): $96.99

80-5 mg (30): $82.99

Tablets (Nadolol-Bendroflumethiazide)

40-5 mg (100): $219.99

Mechanism of ActionSee individual agents.

Pharmacodynamics/KineticsAlso see individual agents.

Bioavailability: Bendroflumethiazide: When used in this combination, bioavailability is increased 30% compared to single agent administration.

Dental Health: Effects on Dental TreatmentNadolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine has interacted with nonselective beta-blockers to result in initial hypertensive episode followed by bradycardia

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, depression, insomnia, or confusion

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the effects of beta-blockers. Nadolol has been used to treat akathisia; propranolol preferred. Concurrent use with antipsychotics may potentiate antihypertensive effect or antipsychotic blood levels. Use with MAO inhibitors may cause bradycardia. Effects of benzodiazepines may be increased by beta-blockers; monitor for clinical changes. There are rare reports of agranulocytosis with bendroflumethiazide; use caution with clozapine, carbamazepine, and mirtazapine. May decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor.

Index TermsBendroflumethiazide and Nadolol

International Brand NamesCorgaretic (AE, JO, QA, SA); Corgaretic-40 (ZA); Corgaretic-80 (ZA)

Nadolol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Nadolol may be confused with Mandol®

Corgard® may be confused with Cognex®, Coreg®

Pronunciation(NAY doe lol)

U.S. Brand NamesCorgard®

Canadian Brand NamesAlti-Nadolol; Apo-Nadol®; Corgard®; Novo-Nadolol

Pharmacologic CategoryBeta Blocker, Nonselective

Use: Labeled IndicationsTreatment of hypertension and angina pectoris; prophylaxis of migraine headaches

Use: Unlabeled/InvestigationalPrimary and secondary prophylaxis of variceal hemorrhage

Dosing: Adults

Hypertension, angina: Oral: Initial: 40-80 mg/day, increase dosage gradually by 40-80 mg increments at 3- to 7-day intervals until optimum clinical response is obtained with profound slowing of heart rate. Doses up to 160-240 mg/day in angina and 240-320 mg/day in hypertension may be necessary. Doses as high as 640 mg/day have been used.

Usual dosage range (JNC 7): 40-120 mg once daily

Variceal hemorrhage prophylaxis (unlabeled use) (Garcia-Tsao, 2007): Oral:

Primary prophylaxis: Initial: 40 mg once daily; adjust to maximal tolerated dose. **Note:** Risk factors for hemorrhage include Child-Pugh class B/C or variceal red wale markings on endoscopy.

Secondary prophylaxis: Initial: 40 mg once daily; adjust to maximal tolerated dose

Dosing: ElderlyOral: Initial: 20 mg/day; increase doses by 20 mg increments at 3- to 7-day intervals; usual dosage range: 20-240 mg/day. Adjust for renal impairment.

Dosing: Renal Impairment

Cl_{cr} 31-40 mL/minute: Administer every 24-36 hours or administer 50% of normal dose.

Cl_{cr} 10-30 mL/minute: Administer every 24-48 hours or administer 50% of normal dose.

Cl_{cr} <10 mL/minute: Administer every 40-60 hours or administer 25% of normal dose.

Hemodialysis effects: Moderately dialyzable (20% to 50%) via hemodialysis. Administer dose postdialysis or administer 40 mg supplemental dose. Supplemental dose is not necessary following peritoneal dialysis.

Dosing: Hepatic ImpairmentReduced dose is probably necessary.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken without regard to meals.

ContraindicationsHypersensitivity to nadolol or any component of the formulation; bronchial asthma; sinus bradycardia; sinus node dysfunction; heart block greater than first degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; uncompensated cardiac failure

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Boxed warnings:

- Abrupt withdrawal: See “Other warnings/precautions” below.

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.

- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition (efficacy of nadolol in HF has not been demonstrated).

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustments are required.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.

- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: **[U.S. Boxed Warning]: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.**

Geriatric Considerations Due to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults. Must adjust dose for renal function.

Pregnancy Risk Factor C

Pregnancy Considerations No data available on crossing the placenta. Beta-blockers have been associated with bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Alternative beta-blockers are preferred for use during pregnancy due to limited data and prolonged half-life. Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Monitor breast-fed infant for symptoms of beta-blockade.

Lactation Enters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding Considerations Considered compatible by the AAP. However, monitor the infant for signs of beta-blockade (hypotension, bradycardia, etc) with long-term use.

Adverse Reactions

>10%:

Central nervous system: Drowsiness, insomnia

Endocrine & metabolic: Decreased sexual ability

1% to 10%:

Cardiovascular: Bradycardia, palpitation, edema, CHF, reduced peripheral circulation

Central nervous system: Mental depression

Gastrointestinal: Diarrhea or constipation, nausea, vomiting, stomach discomfort

Respiratory: Bronchospasm

Miscellaneous: Cold extremities

<1% (Limited to important or life-threatening): Arrhythmias, chest pain, confusion (especially in the elderly), depression, dyspnea, hallucinations, headache, leukopenia, nervousness, orthostatic hypotension, thrombocytopenia

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, garlic, yohimbe, ginseng (may worsen hypertension). Avoid natural licorice (causes sodium and water retention and increases potassium loss).

Nursing: Physical Assessment/MonitoringAssess other medications the patient may be taking for effectiveness and interactions. Assess blood pressure and heart rate prior to and following first dose, any change in dosage, and periodically thereafter. Monitor or advise patient to monitor weight and fluid balance, assess for signs of CHF, and assess therapeutic effectiveness. Monitor serum glucose levels of patients with diabetes since beta-blockers may alter glucose tolerance. Use/teach postural hypotension precautions.

Patient EducationCheck pulse daily prior to taking medication. If pulse is <50, hold medication and consult prescriber. Take exactly as directed; do not adjust dosage or discontinue without consulting prescriber. May cause dizziness, fatigue, blurred vision; change position slowly (lying/sitting to standing) and use caution when driving or engaging in tasks that require alertness until response to drug is known. Exercise and increasing bulk or fiber in diet may help resolve constipation. If you have diabetes, monitor serum glucose closely (the drug may mask symptoms of hypoglycemia). Report swelling in feet or legs, respiratory difficulty or persistent cough, unresolved fatigue, unusual weight gain >5 lb/week, or unresolved constipation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 20 mg, 40 mg, 80 mg

Corgard®: 20 mg, 40 mg, 80 mg, 120 mg [DSC], 160 mg [DSC]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Corgard)

20 mg (30): $87.19

40 mg (30): $97.12

80 mg (30): $103.90

120 mg (30): $99.99

160 mg (30): $113.99

Tablets (Nadolol)

20 mg (30): $11.99

40 mg (30): $15.99

80 mg (30): $19.99

160 mg (30): $33.59

Mechanism of ActionCompetitively blocks response to beta$_1$- and beta$_2$-adrenergic stimulation; does not exhibit any membrane stabilizing or intrinsic sympathomimetic activity. Nonselective beta-adrenergic blockers (propranolol, nadolol) reduce portal pressure by producing splanchnic vasoconstriction (beta$_2$ effect) thereby reducing portal blood flow.
Pharmacodynamics/Kinetics

Duration: 17-24 hours

Absorption: 30% to 40%

Distribution: Concentration in human breast milk is 4.6 times higher than serum

Protein binding: 28%

Half-life elimination: Adults: 10-24 hours; prolonged with renal impairment; End-stage renal disease: 45 hours

Time to peak, serum: 2-4 hours

Excretion: Urine (as unchanged drug)

Related Information

- Beta-Blockers

Dental Health: Effects on Dental TreatmentNadolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine has interacted with nonselective beta-blockers to result in initial hypertensive episode followed by bradycardia
Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, depression, insomnia, or confusion
Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the effects of beta-blockers; has been used to treat akathisia; propranolol preferred; concurrent use with antipsychotics may potentiate antihypertensive effect or antipsychotic blood levels; use with MAO inhibitors may cause bradycardia; effects of benzodiazepines may be increased by beta-blockers; monitor for clinical changes
Cardiovascular ConsiderationsNadolol is a nonspecific beta$_1$- and beta$_2$-blocker.

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation.

Chronic Stable Angina: Beta-blockers are effective in the treatment of chronic stable angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists that requires the use of other drugs, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

ST-Segment Elevation Myocardial Infarction (STEMI): Beta-blockers, without intrinsic sympathomimetic activity (ISA), have been shown to decrease morbidity and mortality when initiated in the acute treatment of STEMI and continued long-term. Oral beta-blockade should be initiated promptly in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade may be considered and given promptly if the patient is experiencing concomitant hypertension or a tachyarrhythmia (Class IIa recommendation).

Unstable Angina/Non-ST-Segment Elevation MI (UA/NSTEMI): In the treatment of UA/NSTEMI, oral beta-blockade should be initiated within the first 24 hours in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade should only be considered if the patient is experiencing concomitant hypertension upon presentation (Class IIa recommendation).

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations**Surgery:** Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Jul, 2006; Yang, 2006).

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(nad roe PA rin)
Canadian Brand NamesFraxiparine™; Fraxiparine™ Forte
Pharmacologic CategoryLow Molecular Weight Heparin
Use: Labeled IndicationsProphylaxis of thromboembolic disorders (particularly deep venous thrombosis and pulmonary embolism) in general and orthopedic surgery; treatment of deep venous thrombosis; prevention of clotting during hemodialysis
Dosing: Adults

Prophylaxis of thromboembolic disorders:

General surgery: SubQ: 2850 anti-Xa int. units; begin 2-4 hours before surgery and continue for 7 days

Hip replacement surgery: SubQ: 38 anti-Xa int. units/kg 12 hours before and 12 hours after surgery, **followed by** 38 anti-Xa int. units/kg/day up to and including day 3, **then** 57 anti-Xa int. units/kg/day for up to 10 days total therapy

Treatment of thromboembolic disorders: SubQ: 171 anti-Xa int. units/kg/day to a maximum of 17,100 int. units; plasma anti-Xa levels should be 1.2-1.8 anti-Xa int. units/mL 3-4 hours postinjection

Patients at increased risk of bleeding: 86 anti-Xa int. units/kg twice daily; plasma anti-Xa levels should be 0.5-1.1 anti-Xa int. units/mL 3-4 hours postinjection

Prevention of clotting during hemodialysis: SubQ: Single dose of 65 anti-Xa int. units/kg into arterial line at start of each dialysis session; may give additional dose if session lasts longer than 4 hours

Patients at risk of hemorrhage: Administer 50% of dose

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentReduced dosage is recommended.
Administration: I.M.Do not administer I.M.
Administration: OtherSubQ injection into anterolateral abdominal wall with subsequent doses to be administered alternately on right and left side of abdominal wall. The thigh may also be used.
StorageStore between 15°C to 30°C (59°F to 86°F); do not freeze or refrigerate.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to nadroparin or any component of the formulation; acute infective endocarditis; hemorrhage or increased risk of hemorrhage (hemostasis disorder), except for disseminated intravascular coagulation (DIC) not induced by heparin; history of thrombocytopenia with nadroparin; organic lesions likely to bleed (active peptic ulceration); hemorrhagic cerebrovascular event; severe uncontrolled hypertension; diabetic or hemorrhagic retinopathy; injuries to or operations on the CNS, eyes, or ears. Not for I.M. administration.
Allergy Considerations

- Low Molecular Weight Heparin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Monitor patient closely for signs or symptoms of bleeding. Certain patients are at increased risk of bleeding. Risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; active ulcerative or angiodysplastic GI diseases; severe uncontrolled hypertension; hemorrhagic stroke; or use shortly after brain, spinal, or ophthalmology surgery; in patient treated concomitantly with platelet inhibitors; recent GI bleeding; thrombocytopenia or platelet defects; severe liver disease; hypertensive or diabetic retinopathy; or in patients undergoing invasive procedures. Discontinue if bleeding occurs.

- Hyperkalemia: Monitor for hyperkalemia. Heparin can cause hyperkalemia by affecting aldosterone; similar reactions could occur with LMWHs.

- Thrombocytopenia: Rare cases of thrombocytopenia have occurred. Use with caution in patients with history of heparin-induced thrombocytopenia; monitor platelet count closely. Consider discontinuation of therapy in any patient developing significant thrombocytopenia. Rare cases of thrombocytopenia with thrombosis have occurred. Use caution in patients with congenital or drug-induced thrombocytopenia or platelet defects.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic disease.

- Renal impairment: Use with caution in patients with severe renal disease.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Do not use when abortion is imminent or threatened.

Other warnings/precautions:

- Conversion to other products: Not to be used interchangeably (unit for unit) with heparin or any other low molecular weight heparins.
- Neuraxial anesthesia: Patients with recent or anticipated neuraxial anesthesia (epidural or spinal anesthesia) are at risk of spinal or epidural hematoma and subsequent paralysis. Consider risk versus benefit prior to neuraxial anesthesia; risk is increased by concomitant agents which may alter hemostasis, as well as traumatic or repeated epidural or spinal puncture. Patient should be observed closely for bleeding and signs and symptoms of neurological impairment if therapy is administered during or immediately following diagnostic lumbar puncture, epidural anesthesia, or spinal anesthesia.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal and human reports have not shown any teratogenic of fetotoxic effects. Data concerning transplacental passage is limited, but has not been detected.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Dermatologic: Rash

Endocrine & metabolic: Hypoaldosteronism (causing hyperkalemia and/or hyponatremia)

Hematological: Bleeding, thrombocytopenia

Hepatic: ALT increased, AST increased

Local: Injection site hematoma, pain at injection site

Neuromuscular & skeletal: Osteopenic effects

Miscellaneous: Allergic reactions

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: Heparin (Low Molecular Weight) may enhance the adverse/toxic effect of Drotrecogin Alfa. This is of most concern with therapeutic doses of LMW heparin. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, garlic, ginseng (all have anticoagulant or antiplatelet activity).

Monitoring ParametersBleeding complications including stool occult blood tests, hemoglobin, antifactor Xa determinations, platelet counts

Monitoring: Lab TestsBleeding complications including stool occult blood tests, hemoglobin, antifactor Xa determinations, platelet counts

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution, as calcium:

Fraxiparine™ [CAN]:

9500 anti-Xa int. units/mL (0.2 mL, 0.3 mL, 0.4 mL) [ungraduated prefilled syringe]

9500 anti-Xa int. units/mL (0.6 mL, 0.8 mL, 1 mL) [graduated prefilled syringe]

Fraxiparine™ Forte [CAN]: 19,000 anti-Xa int. units/mL (0.6 mL, 0.8 mL, 1 mL) [graduated prefilled syringe]

Generic AvailableNo
ManufacturerAventis Pharma (Canada)
Mechanism of ActionNadroparin has high anti-Xa activity, but low anti-IIa activity. The greater ratio of anti-Xa activity has the potential to provide equivalent antithrombic efficacy with reduced hemorrhagic complications.
Pharmacodynamics/Kinetics

Duration: 18 hours

Absorption: SubQ: ≥89%

Time to peak, serum: 3-5 hours

Half-life elimination: 3.5 hours; Renal impairment: 6 hours

Excretion: Urine

Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentMay cause thrombocytopenia; concomitant use with valproic acid may increase the risk; monitor
Cardiovascular ConsiderationsLow molecular weight heparins (LMWHs) compare favorably to unfractionated heparin (UFH) in the prevention and treatment of venous thromboembolism. LMWHs are associated with less thrombocytopenia, compared to heparin, and do not require routine therapeutic monitoring. The role of nadroparin in the treatment of acute coronary syndromes is not established.

Obesity/Renal Dysfunction: There is no consensus for adjusting/correcting the weight-based dosage of LMWH for patients who are morbidly obese. Monitoring of antifactor Xa concentration 4 hours after injection may be warranted. Patients who have a reduction in calculated creatinine clearance are at risk of accumulated anticoagulant effect when they are treated with certain LMWHs. All LMWHs may not behave the same in patients with renal dysfunction. Some clinicians monitor anti-Xa levels for patients with Cl_{cr} <30 mL/minute.

Medication Safety Issues

Sound-alike/look-alike issues:

Nafarelin may be confused with Anafranil®, enalapril

Pronunciation(naf a REL in)

U.S. Brand NamesSynarel®

Canadian Brand NamesSynarel®

Pharmacologic CategoryGonadotropin Releasing Hormone Agonist

Use: Labeled IndicationsTreatment of endometriosis, including pain and reduction of lesions; treatment of central precocious puberty (CPP; gonadotropin-dependent precocious puberty) in children of both sexes

Dosing: Adults**Endometriosis:** Intranasal: Female: 1 spray (200 mcg) in 1 nostril each morning and the other nostril each evening starting on days 2-4 of menstrual cycle (total: 2 sprays/day). Dose may be increased to 2 sprays (400 mcg; 1 spray in each nostril) in the morning and evening if amenorrhea is not achieved (total: 8 sprays [1600 mcg]/day). Total duration of therapy should not exceed 6 months due to decreases in bone mineral density; retreatment is not recommended by the manufacturer.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Central precocious puberty:** Intranasal: Male/Female: 2 sprays (400 mcg) into each nostril in the morning and 2 sprays (400 mcg) into each nostril in the evening (total: 8 sprays [1600 mcg]/day). If inadequate suppression, may increase dose to 3 sprays (600 mcg) into alternating nostrils 3 times/day (total: 9 sprays [1800 mcg]/day).

Administration: InhalationNasal spray: Do not use topical nasal decongestant for at least 2 hours after nafarelin use. Allow ~30 seconds to elapse between sprays. Sneezing during or immediately after dosing should be avoided (may decrease drug absorption).

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to gonadotropin-releasing hormone (GnRH), GnRH-agonist analogs, or any component of the formulation; undiagnosed abnormal vaginal bleeding; pregnancy; breast-feeding

Allergy Considerations

- GnRH Agonist Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Ovarian cysts: May occur within the first 2 months of therapy and may occur more commonly in women with polycystic ovarian disease.

Disease-related concerns:

- CPP use: When used for the treatment of CPP, some signs of puberty (eg vaginal bleeding, breast enlargement) may occur but should resolve within the first 2 months of therapy.

- Decreased bone mineral density: Use with caution in patients with risk factors for decreased bone mineral density; may pose an additional risk.

Pregnancy Risk FactorX

Pregnancy ConsiderationsMajor fetal abnormalities have been reported in some animal studies; a dose-related increase in fetal mortality and decrease in fetal weight was also observed. Ovulation is inhibited and menstruation is stopped when used appropriately for the treatment of endometriosis, however contraception is not assured. Nonhormonal contraception is recommended. Pregnancy should be excluded prior to initiating treatment. There is no evidence that pregnancy rates are enhanced or adversely affected by use.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions**Note:** Adverse events may be more frequent in the first 6 weeks of treatment due to stimulation of the pituitary-gonadal axis. Sensitivity reactions included chest pain, pruritus, shortness of breath, rash.

CPP: 1% to 10%:

Central nervous system: Emotional lability (6%)

Dermatologic: Acne (10%), seborrhea (3%)

Endocrine & metabolic: Breast enlargement (8%; transient), vaginal bleeding (8%), hot flashes (3%; transient), vaginal discharge (3%)

Respiratory: Rhinitis (5%)

Miscellaneous: Pubic hair increased (5%; transient), body odor (4%), sensitivity reactions (3%)

Endometriosis:

- >10%:
  - Central nervous system: Headache, emotional lability
  - Dermatologic: Acne
  - Endocrine & metabolic: Hot flashes (90%), hyperphosphatemia, hypertriglyceridemia, hypocalcemia, libido decreased
  - Genitourinary: Vaginal dryness
  - Hematologic: Leukopenia
- 1% to 10%:
  - Cardiovascular: Edema
  - Central nervous system: Depression, insomnia
  - Dermatologic: Hirsutism, seborrhea
  - Endocrine & metabolic: Breast size reduced, cholesterol increased, hyperlipidemia, libido increased
  - Gastrointestinal: Weight gain/loss
  - Neuromuscular & skeletal: Bone mineral density decreased, myalgia
  - Respiratory: Nasal irritation

<1%: Arthralgia, breast engorgement, chloasma, eye pain, lactation, maculopapular rash, palpitation, paresthesia, sensitivity reactions, weakness

Postmarketing and/or case reports (any indication): ALT increased, AST increased, pituitary apoplexy, pituitary gland changes

Drug Interactions

Antidiabetic Agents: Luteinizing Hormone-Releasing Hormone Analogs may diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Test InteractionsDiagnostic tests of pituitary gonadotropic and gonadal functions during and up to 4-8 weeks after discontinuing treatment may be misleading.

Monitoring Parameters

CPP: Bone mineral density, GnRH testing (blood LH and FSH levels), measurement of bone age, Tanner staging

Endometriosis: Menstruation, vaginal bleeding or spotting which persists after 2 months of treatment

Nursing: Physical Assessment/MonitoringFor treatment of precocious puberty, consult appropriate pediatric reference. Assess therapeutic effectiveness and adverse response. Teach patient (caregiver) proper use (correct timing and administration of nasal spray), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that female patient is not pregnant before beginning therapy. Do not give to childbearing age female unless capable of complying with contraceptive use.

Monitoring: Lab TestsCPP: GnRH testing (blood LH and FSH levels)

Patient EducationEndometriosis: You will begin this treatment between days 2-4 of your regular menstrual cycle. Use as directed, daily at the same time (arising and bedtime), and rotate nostrils. Maintain regular follow-up schedule. May cause hot flashes, flushing, or redness (cold cloth and cool environment may help); decreased or increased libido; emotional lability; weight gain; decreased breast size; or hirsutism. Report any breakthrough bleeding or continuing menstruation or musculoskeletal pain. Do not use a nasal decongestant within 2 hours after nafarelin. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for instruction on appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, intranasal [spray]:

- Synarel®: 2 mg/mL (8 mL) [200 mcg/spray: 60 metered sprays; contains benzalkonium chloride]

Generic AvailableNo

ManufacturerSearle

Pricing: U.S. (www.drugstore.com)

Solution (Synarel)

- 2 mg/mL (8): $948.26

Mechanism of ActionPotent synthetic decapeptide analogue of gonadotropin-releasing hormone (GnRH; LHRH) which is approximately 200 times more potent than GnRH in terms of pituitary release of luteinizing hormone (LH) and follicle-stimulating hormone (FSH). Effects on the pituitary gland and sex hormones are dependent upon its length of administration. After acute administration, an initial stimulation of the release of LH and FSH from the pituitary is observed; an increase in androgens and estrogens subsequently follows. Continued administration of nafarelin, however, suppresses gonadotrope responsiveness to endogenous GnRH resulting in reduced secretion of LH and FSH and, secondarily, decreased ovarian and testicular steroid production.

Pharmacodynamics/Kinetics

Protein binding, plasma: 80%

Metabolism: Degraded by peptidase; forms metabolites

Bioavailability: ~1% to 6%

Half-life elimination: ~3 hours; Metabolites: ~86 hours

Time to peak, serum: 10-45 minutes

Excretion: Urine (44% to 55%, ~3% as unchanged drug); feces (19% to 44%)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Emotional lability is common; may cause insomnia

Mental Health: Effects on Psychiatric Treatment None reported

Nafcillin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(naf SIL in)

Canadian Brand NamesNallpen®; Unipen®

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of infections such as osteomyelitis, septicemia, endocarditis, and CNS infections caused by susceptible strains of staphylococci species

Dosing: Adults

Susceptible infections:

I.M.: 500 mg every 4-6 hours

I.V.: 500-2000 mg every 4-6 hours

Endocarditis: MSSA:

Native valve: I.V.: 12 g/24 hours in 4-6 divided doses for 6 weeks

Prosthetic valve: I.V.: 12 g/24 hours in 6 divided doses for ≥6 weeks (use with rifampin and gentamicin)

Joint:

Bursitis, septic: I.V.: 2 g every 4 hours

Prosthetic: I.V.: 2 g every 4-6 hours with rifampin for 6 weeks

***Staphylococcus aureus,*methicillin-susceptible infections, including brain abscess, empyema, erysipelas, mastitis, myositis, orbital cellulitis, osteomyelitis, pneumonia, splenic abscess, toxic shock, urinary tract (perinephric abscess):** I.V.: 2 g every 4 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Neonates:

Usual dosage range: I.M., I.V.:

1200-2000 g, <7 days: 50 mg/kg/day divided every 12 hours

>2000 g, <7 days: 75 mg/kg/day divided every 8 hours

1200-2000 g, ≥7 days: 75 mg/kg/day divided every 8 hours

>2000 g, ≥7 days: 100-140 mg/kg/day divided every 6 hours

Children:

I.M.: 25 mg/kg twice daily

I.V.:

Mild-to-moderate infections: 50-100 mg/kg/day in divided doses every 6 hours

Severe infections: 100-200 mg/kg/day in divided doses every 4-6 hours (maximum: 12 g/day)

Staphylococcal endocarditis:

Native valve: 200 mg/kg/day in divided doses every 4-6 hours for 6 weeks

Prosthetic valve: 200 mg/kg/day in divided doses every 4-6 hours for ≥6 weeks (use with rifampin and gentamicin)

Dosing: Renal ImpairmentNot necessary unless renal impairment is in the setting of concomitant hepatic impairment.

Hemodialysis effects: Not dialyzable (0% to 5%) via hemodialysis. Supplemental dose is not necessary with hemo- or peritoneal dialysis or continuous arteriovenous or venovenous hemofiltration.

Dosing: Hepatic ImpairmentIn patients with both hepatic and renal impairment, modification of dosage may be necessary; no data available.

Administration: I.M.Rotate injection sites.

Administration: I.V.Vesicant. Administer around-the-clock to promote less variation in peak and trough serum levels. Infuse over 30-60 minutes.

Administration: I.V. Detail**Extravasation management:** Use cold packs.

Hyaluronidase: Add 1 mL NS to 150 unit vial to make 150 units/mL of concentration; mix 0.1 mL of above with 0.9 mL NS in 1 mL syringe to make final concentration = 15 units/mL.

pH: 6.0-8.5

Dietary ConsiderationsPremixed injection may contain corn-derived dextrose and its use is contraindicated in patients with allergy to corn-related products. Sodium content of 1 g: 76.6 mg (3.33 mEq).

Storage

Premixed infusions: Store in a freezer at -20°C (4°F). Thaw at room temperature or under refrigeration only. Thawed bags are stable for 21 days under refrigeration or 72 hours at room temperature. Do not refreeze.

Vials: Reconstituted parenteral solution is stable for 3 days at room temperature and 7 days when refrigerated or 12 weeks when frozen. For I.V. infusion in NS or D_5W, solution is stable for 24 hours at room temperature and 96 hours when refrigerated.

CompatibilityStable in dextran 40 10% in dextrose, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}NS$, $D_{10}W$, LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solution, TPN.

Y-site administration: Compatible: Acyclovir, atropine, cyclophosphamide, diazepam, enalaprilat, esmolol, famotidine, fentanyl, fluconazole, foscarnet, heparin, hydromorphone, magnesium sulfate, morphine, nicardipine, perphenazine, propofol, theophylline, zidovudine. **Incompatible:** Droperidol, fentanyl and droperidol, insulin (regular), labetalol, midazolam, nalbuphine, pentazocine, verapamil. **Variable (consult detailed reference):** Diltiazem, meperidine, TPN, vancomycin.

Compatibility in syringe: Compatible: Cimetidine, heparin.

Compatibility when admixed: Compatible: Chloramphenicol, chlorothiazide, dexamethasone sodium phosphate, diphenhydramine, ephedrine, heparin, hydroxyzine, lidocaine, potassium chloride, prochlorperazine edisylate, sodium bicarbonate, sodium lactate. **Incompatible:** Ascorbic acid injection, aztreonam, bleomycin, cytarabine, gentamicin, hydrocortisone sodium succinate, methylprednisolone sodium succinate, promazine. **Variable (consult detailed reference):** Aminophylline, verapamil, vitamin B complex with C.

ContraindicationsHypersensitivity to nafcillin, or any component of the formulation, or penicillins; premixed injection may contain corn-derived dextrose and its use is contraindicated in patients with allergy to corn-related products

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic/renal impairment: Use with caution in patients with concomitant hepatic and renal impairment; dosage adjustment recommended.

Special populations:

- Neonates: Use with caution in neonates; elimination of drug is slow.

Other warnings/precautions:

- Extravasation: Avoid extravasation of I.V. infusions.

Geriatric ConsiderationsNafcillin has not been studied exclusively in the elderly, however, given its route of elimination, dosage adjustments based upon age and renal function is not necessary

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, nafcillin is classified as pregnancy category B. There is no available data on the placental transfer of nafcillin. Human experience with the penicillins during pregnancy has not shown any positive evidence of adverse effects on the fetus.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsIt is not known if nafcillin crosses into human milk. The manufacturer recommends that caution be exercised when administering nafcillin to nursing women. Other penicillins distribute into human milk and are considered safe for use during breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Nafcillin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Neurotoxicity (high doses)

Gastrointestinal: Pseudomembranous colitis

Hematologic: Agranulocytosis, bone marrow depression, neutropenia

Local: Inflammation, pain, phlebitis, skin sloughing, swelling, and thrombophlebitis at the injection site; oxacillin (less likely to cause phlebitis) is often preferred in pediatric patients; tissue necrosis with sloughing (SubQ extravasation)

Renal: Interstitial nephritis (rare), renal tubular damage (rare)

Miscellaneous: Anaphylaxis, hypersensitivity reactions (immediate and delayed; general incidence of 1% to 10% for penicillins), serum sickness

Oncology: VesicantYes; see Management of Drug Extravasations.
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Induces** CYP3A4 (strong)
Drug Interactions

Calcium Channel Blockers: Nafcillin may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CycloSPORINE: Nafcillin may increase the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Nafcillin may increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Nafcillin may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsPositive Coombs' test (direct), false-positive urinary and serum proteins; may inactivate aminoglycosides *in vitro*
Monitoring ParametersBaseline and periodic CBC with differential; periodic urinalysis, BUN, serum creatinine, AST and ALT; observe for signs and symptoms of anaphylaxis during first dose
Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and allergy history prior to starting therapy. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased [toxic] or decreased [subtherapeutic] levels/effects. Infusion/Injection site must be monitored closely to prevent extravasation (use ice packs). Assess for therapeutic effect (resolution of infection) and adverse reactions (eg, hypersensitivity, opportunistic infection [eg, fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue)]. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy. Monitor renal, hepatic, CBC with prolonged therapy.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion or injection. Report immediately any redness, swelling, burning, or pain at injection/infusion site; respiratory difficulty or swallowing; chest pain; persistent diarrhea; or rash. May cause nausea (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or opportunistic infection (eg, fever, chills, sore throat, burning urination, fatigue). Report persistent side effects or if condition does not respond to treatment. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed iso-osmotic dextrose solution]: 1 g (50 mL); 2 g (100 mL)

Injection, powder for reconstitution, as sodium: 1 g, 2 g, 10 g

Generic AvailableYes
Mechanism of ActionInterferes with bacterial cell wall synthesis during active multiplication, causing cell wall death and resultant bactericidal activity against susceptible bacteria
Pharmacodynamics/Kinetics

Distribution: Widely distributed; CSF penetration is poor but enhanced by meningeal inflammation

Protein binding: ~90%; primarily to albumin

Metabolism: Primarily hepatic; undergoes enterohepatic recirculation

Half-life elimination:

Neonates: <3 weeks: 2.2-5.5 hours; 4-9 weeks: 1.2-2.3 hours

Children 3 months to 14 years: 0.75-1.9 hours

Adults: Normal renal/hepatic function: 30-60 minutes

Time to peak, serum: I.M.: 30-60 minutes

Excretion: Primarily feces; urine (10% to 30% as unchanged drug)

Naftifine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(NAF ti feen)

U.S. Brand NamesNaftin®

Pharmacologic CategoryAntifungal Agent, Topical

Use: Labeled IndicationsTopical treatment of tinea cruris (jock itch), tinea corporis (ringworm), and tinea pedis (athlete's foot)

Dosing: Adults**Tinea infection:** Topical: Apply cream once daily and gel twice daily (morning and evening) for up to 4 weeks

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to naftifine or any component of the formulation

Allergy Considerations

- Allylamine Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occurs

Special population:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes, nose, mouth, or mucous membranes.

Geriatric ConsiderationsNo specific recommendations for use in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic events were not observed in animal studies.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Dermatologic: Burning/stinging (5% to 6%), erythema (≤2%), pruritus (1% to 2%)

Local: Dryness (3%), irritation (2%)

<1%: Rash, skin tenderness

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, as hydrochloride:

Naftin®: 1% (15 g, 30 g, 60 g, 90 g) [contains benzyl alcohol]

Gel, as hydrochloride:

Naftin®: 1% (20 g, 40 g, 60 g, 90 g) [contains alcohol 52%]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Cream (Naftin)

1% (30): $79.08

1% (60): $129.25

Gel (Naftin)

1% (20): $68.90

1% (40): $118.78

1% (60): $154.44

Mechanism of ActionSynthetic, broad-spectrum antifungal agent in the allylamine class; appears to have both fungistatic and fungicidal activity. Exhibits antifungal activity by selectively inhibiting the enzyme squalene epoxidase in a dose-dependent manner which results in a reduced synthesis of ergosterol, the primary sterol within the fungal membrane.

Pharmacodynamics/Kinetics

Absorption: Systemic: Cream: 6%; Gel: ≤4%

Half-life elimination: 2-3 days

Excretion: Urine and feces (as unchanged drug and/or metabolites)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Naftifine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Nubain® may be confused with Navane®, Nebcin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(NAL byoo feen)

U.S. Brand NamesNubain®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsRelief of moderate to severe pain; preoperative analgesia, postoperative and surgical anesthesia, and obstetrical analgesia during labor and delivery

Use: Unlabeled/InvestigationalOpioid-induced pruritus

Dosing: Adults

Pain management: I.M., I.V., SubQ: 10 mg/70 kg every 3-6 hours; maximum single dose in nonopioid-tolerant patients: 20 mg; maximum daily dose: 160 mg

Surgical anesthesia supplement: I.V.: Induction: 0.3-3 mg/kg over 10-15 minutes; maintenance doses of 0.25-0.5 mg/kg may be given as required

Opioid-induced pruritus (unlabeled use): I.V. 2.5-5 mg; may repeat dose

Dosing: ElderlyRefer to adult dosing; use with caution.

Dosing: Pediatric**Pain management (unlabeled use):** Children ≥1 year: I.M., I.V., SubQ: 0.1-0.2 mg/kg every 3-4 hours as needed; maximum: 20 mg/dose and/or 160 mg/day

Dosing: Renal ImpairmentUse with caution and reduce dose. Monitor.

Dosing: Hepatic ImpairmentUse with caution and reduce dose.

Calculations

- Opioid Agonist Conversion

Administration: I.V. DetailpH: 3.5-3.7 (adjusted)

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

CompatibilityStable in D_5NS, $D_{10}W$, LR, NS.

Y-site administration: Compatible: Amifostine, aztreonam, cisatracurium, cladribine, etoposide, filgrastim, fludarabine, gatifloxacin, gemcitabine, granisetron, linezolid, melphalan, paclitaxel, propofol, remifentanil, teniposide, thiotepa, vinorelbine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, docetaxel, ketorolac, methotrexate, nafcillin, piperacillin/tazobactam, sargramostim, sodium bicarbonate.

Compatibility in syringe: Compatible: Atropine, cimetidine, diphenhydramine, droperidol, glycopyrrolate, hydroxyzine, lidocaine, midazolam, prochlorperazine edisylate, ranitidine, scopolamine, trimethobenzamide. **Incompatible:** Diazepam, ketorolac, pentobarbital. **Variable (consult detailed reference):** Promethazine, thiethylperazine.

Compatibility when admixed: Variable (consult detailed reference): Promethazine.

ContraindicationsHypersensitivity to nalbuphine or any component of the formulation

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- CNS depression/coma: Use with caution in patients with CNS depression or coma.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with decreased hepatic function.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Renal impairment: Use with caution in patients with decreased renal function.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: Use with caution in pregnancy; close neonatal monitoring required when used in labor and delivery.

Other warnings/precautions:

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly may be particularly susceptible to CNS effects; monitor closely.
Pregnancy Risk FactorB/D (prolonged use or high doses at term)
Pregnancy ConsiderationsSevere fetal bradycardia has been reported following use in labor/delivery. Fetal bradycardia may occur when administered earlier in pregnancy (not documented). Use only if clearly needed, with monitoring to detect and manage possible adverse fetal effects. Naloxone has been reported to reverse bradycardia. Newborn should be monitored for respiratory depression or bradycardia following nalbuphine use in labor.
LactationEnters breast milk/use caution
Adverse Reactions

>10%: Central nervous system: Sedation (36%)

1% to 10%:

Central nervous system: Dizziness (5%), headache (3%)

Gastrointestinal: Nausea/vomiting (6%), xerostomia (4%)

Miscellaneous: Clamminess (9%)

<1%: Anaphylaxis, anaphylactoid reaction, asthma, bitter taste, blurred vision, bradycardia, cardiac arrest, confusion, crying, delusion, depersonalization, depression, diaphoresis, dreams (abnormal), dyspepsia, dysphoria, dyspnea, euphoria, faintness, floating sensation, flushing, gastrointestinal cramps, hallucinations, hostility, hypertension, hypotension, laryngeal edema, nervousness, numbness, pruritus, rash, respiratory depression, respiratory distress, restlessness, sensation of warmth/burning, speech disorder, stridor, tachycardia, tingling, tremor, unreality, urinary urgency, urticaria

Postmarketing and/or case reports: Abdominal pain, agitation, allergic reaction, anxiety, fever ; injection site reactions (pain, swelling, redness, burning); loss of consciousness, pulmonary edema, seizure, somnolence

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic

doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRelief of pain, respiratory and mental status, blood pressure

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness (eg, pain relief) and adverse reactions at beginning of therapy and periodically throughout therapy. Monitor blood pressure, CNS and respiratory status, and degree of sedation at beginning of therapy and at regular intervals during use. For inpatients, implement safety measures. Generally used in conjunction with surgical anesthesia or during labor and delivery; however, if self-administered for relief of pain, assess knowledge/teach patient appropriate use, adverse reactions to report, and appropriate interventions to reduce side effects.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); loss of appetite, nausea, or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report chest pain, slow or rapid heartbeat, acute dizziness or persistent headache; changes in mental status; swelling of extremities or unusual weight gain; changes in urinary elimination or pain on urination; acute headache; back or flank pain or muscle spasms; blurred vision; skin rash; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. If you are breast-feeding, take medication immediately after breast-feeding or 3-4 hours prior to next feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution, as hydrochloride: 10 mg/mL (10 mL); 20 mg/mL (10 mL)

Nubain®: 10 mg/mL (10 mL) [DSC]; 20 mg/mL (10 mL)

Injection, solution, as hydrochloride [preservative free]: 10 mg/mL (1 mL); 20 mg/mL (1 mL)

Nubain®: 10 mg/mL (1 mL); 20 mg/mL (1 mL)

Generic AvailableYes

Mechanism of ActionAgonist of kappa opiate receptors and partial antagonist of mu opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression

Pharmacodynamics/Kinetics

Onset of action: Peak effect: SubQ, I.M.: <15 minutes; I.V.: 2-3 minutes

Metabolism: Hepatic

Half-life elimination: 5 hours

Excretion: Feces; urine (~7% as metabolites)

Related Information

- Narcotic / Opioid Analgesics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause dizziness; may rarely cause restlessness, nervousness, confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropic may produce additive sedation

Anesthesia and Critical Care Concerns/Other ConsiderationsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Mixed agonist-antagonist: Incidence of psychomimetic effect is lower than with pentazocine; may precipitate withdrawal in narcotic-dependent patients.

Index Terms Nalbuphine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Revex® may be confused with Nimbex®, ReVia®, Rubex®

Color-coded ampuls denote indication-specific concentrations:

Blue-labeled ampul (for postoperative use) contains 1 mL (100 mcg/mL)

Green-labeled ampul (for overdose management) contains 2 mL (1 mg/mL)

International issues:

Revex® may be confused with Brivex® which is a brand name for brivudine in Switzerland

Revex® may be confused with Rubex® which is a brand name for ascorbic acid in Ireland

Pronunciation(NAL me feen)

U.S. Brand NamesRevex® [DSC]

Pharmacologic CategoryAntidote; Opioid Antagonist

Use: Labeled IndicationsComplete or partial reversal of opioid drug effects, including respiratory depression induced by natural or synthetic opioids; reversal of postoperative opioid depression; management of known or suspected opioid overdose

Dosing: Adults

Reversal of postoperative opioid depression: I.V.: Blue-labeled product (100 mcg/mL): Titrate to reverse the undesired effects of opioids; initial dose for nonopioid dependent patient: 0.25 mcg/kg followed by 0.25 mcg/kg incremental doses at 2- to 5-minute intervals. After a total dose >1 mcg/kg, further therapeutic response is unlikely.

Note: In patients with increased cardiovascular risks, dilute 1:1 in NS or SWFI, and initiate/titrate with 0.1 mcg/kg doses.

Management of known/suspected opioid overdose: I.V. (preferred route): Green-labeled product (1 mg/mL):

Nonopioid-dependent patients: 0.5 mg/70 kg; may repeat with 1 mg/70 kg in 2-5 minutes; further increase beyond a total dose of 1.5 mg/70 kg will not likely result in improved response and may result in cardiovascular stress and precipitated withdrawal syndrome

Opioid-dependent patients: Administer a challenge dose of 0.1 mg/70 kg; if no withdrawal symptoms are observed in 2 minutes, give 0.5 mg/70 kg; may repeat with 1 mg/70 kg in 2-5 minutes; further increase beyond a total dose of 1.5 mg/70 kg will not likely result in improved response and may result in cardiovascular stress and precipitated withdrawal syndrome

Recurrence of respiratory depression: If noted, dose may again be titrated to clinical effect using incremental doses.

Loss of I.V. access: If I.V. access is lost or not readily obtainable, a single SubQ or I.M. dose of 1 mg may be effective in 5-15 minutes.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot necessary with single use, however, slow administration (over 60 seconds) of incremental doses is recommended to minimize hypertension and dizziness.

Dosing: Hepatic ImpairmentNo adjustment necessary with single use.

Administration: I.M.If I.V. access is lost or not readily obtainable, a single SubQ or I.M. dose of 1 mg may be effective in 5-15 minutes.

Administration: I.V.Slow administration (over 60 seconds) of incremental doses is recommended to minimize hypertension and dizziness in renal patients.

Administration: I.V. DetailCheck dosage strength carefully before use to avoid error. Dilute drug (1:1) with diluent and use smaller doses in patients known to be at increased cardiovascular risk. May be administered via I.M. or SubQ routes if I.V. access is not feasible.

pH: 3.9 (adjusted)

StorageStore at controlled room temperature.

CompatibilityStable in D_5LR, $D_5{}^1/_2NS$, D_5W, LR, sodium bicarbonate 5%, $^1/_2NS$, NS.

ContraindicationsHypersensitivity to nalmefene or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Acute opioid withdrawal: May precipitate symptoms of acute withdrawal in opioid-dependent patients, including pain, hypertension, sweating, agitation, and irritability.

- Buprenorphine-induced respiratory depression: Animal studies indicate nalmefene may not completely reverse buprenorphine-induced respiratory depression.

- Hypersensitivity: Nalmefene is structurally similar to both naltrexone and naloxone; patients with hypersensitivity to these agents may also react to nalmefene.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease or in patients receiving medications with potential adverse cardiovascular effects (eg, hypotension, pulmonary edema or arrhythmias); pulmonary edema and cardiovascular instability, including ventricular fibrillation, have been reported in association with abrupt reversal when using narcotic antagonists.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Flumazenil: Concurrent use of flumazenil and nalmefene may increase the risk of seizures.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Concentrated product: Two products are available at different concentrations. A blue-labeled ampul contains a 100 mcg/mL solution of nalmefene and is intended for postoperative use. A green-labeled ampul contains a 1 mg/mL (**10** times as concentrated; **20** times as much drug) and is intended to be used for the management of an overdose.

Other warnings/precautions:

- Opioid dependence: Discharged patients who are opioid-dependent may attempt to override the narcotic-blocking effect of nalmefene. Patients are at a greater risk of overdose when nalmefene wears off if megadosing of opiates has occurred. Adequate duration of monitoring should be provided.

- Opioid overdose: Recurrence of respiratory depression is possible if the opioid involved is long-acting; observe patients until there is no reasonable risk of recurrent respiratory depression.

- Postoperative reversal: Appropriate use: Excessive dosages should be avoided after use of opiates in surgery. Abrupt postoperative reversal may result in nausea, vomiting, sweating, tachycardia, hypertension, seizures, and other cardiovascular events (including pulmonary edema and arrhythmias).

Pregnancy Risk FactorB
Pregnancy ConsiderationsAnimal studies have not demonstrated fetal harm or fertility impairment. There are no adequate and well-controlled studies in pregnant women. Use only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsLimited information available; do not use in lactating women if possible.
Adverse Reactions

>10%: Gastrointestinal: Nausea (18%)

1% to 10%:

Cardiovascular: Tachycardia (5%), hypertension (5%), hypotension (1%), vasodilation (1%)

Central nervous system: Fever (3%), dizziness (3%), headache (1%), chills (1%)

Gastrointestinal: Vomiting (9%)

Miscellaneous: Postoperative pain (4%)

<1%: Agitation, arrhythmia, AST increased, bradycardia, confusion, depression, diarrhea, myoclonus, nervousness, pharyngitis, pruritus, somnolence, tremor, urinary retention, withdrawal syndrome, xerostomia

Postmarketing and/or case reports: Pulmonary edema

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersSymptoms of withdrawal; neurological status, oxygenation, pain, vital signs
Nursing: Physical Assessment/MonitoringAssess patient for opioid dependency. Monitor vital signs, respiratory, and cardiac status carefully during infusion and for some time thereafter (effects may continue for several days, use nonopioid analgesics for pain).
Patient EducationThis drug can only be administered I.V. You may experience drowsiness, dizziness, or blurred vision for several days; use caution when driving or engaging in tasks requiring alertness until response to drug is known. Small frequent meals and good mouth care may reduce any nausea or vomiting. Report yellowing of eyes or skin, unusual bleeding, dark or tarry stools, acute headache, respiratory difficulty, or palpitations. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Revex®: 100 mcg/mL (1 mL) [blue label]; 1 mg/mL (2 mL) [green label] [DSC]

Generic AvailableNo
ManufacturerBaxter Pharmaceuticals Products, Inc

Mechanism of Action As a 6-methylene analog of naltrexone, nalmefene acts as a competitive antagonist at opioid receptor sites, preventing or reversing the respiratory depression, sedation, and hypotension induced by opiates; no pharmacologic activity of its own (eg, opioid agonist activity) has been demonstrated

Pharmacodynamics/Kinetics

Onset of action: I.M., SubQ: 5-15 minutes

Distribution: V_d: 8.6 L/kg; rapid

Protein binding: 45%

Metabolism: Hepatic via glucuronide conjugation to metabolites with little or no activity

Bioavailability: I.M., SubQ: 100%

Half-life elimination: 10.8 hours

Time to peak, serum: Serum: I.M.: 2.3 hours; I.V.: <2 minutes; SubQ: 1.5 hours

Excretion: Feces (17%); urine (<5% as unchanged drug)

Clearance: 0.8 L/hour/kg

Pharmacotherapy Pearls Proper steps should be used to prevent use of the incorrect dosage strength. The goal of treatment in the postoperative setting is to achieve reversal of excessive opioid effects without inducing a complete reversal and acute pain.

If opioid dependence is suspected, nalmefene should only be used in opioid overdose if the likelihood of overdose is high based on history or the clinical presentation of respiratory depression with concurrent pupillary constriction is present.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness; may rarely cause agitation, confusion, depression, nervousness, and sedation

Mental Health: Effects on Psychiatric Treatment May precipitate opioid withdrawal in dependent patients

Anesthesia and Critical Care Concerns/Other Considerations Proper steps should be used to prevent use of the incorrect dosage strength. The goal of treatment in the postoperative setting is to achieve reversal of excessive opioid effects without inducing a complete reversal and acute pain. If opioid dependence is suspected, nalmefene should only be used in opioid overdose if the likelihood of overdose is high, based on history or the clinical presentation of respiratory depression with concurrent pupillary constriction present.

Index Terms Nalmefene Hydrochloride

Naloxone

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Naloxone may be confused with naltrexone

Narcan® may be confused with Marcaine®, Norcuron®

International issues:

Narcan® may be confused with Marcen® which is a brand name for ketazolam in Spain

Pronunciation(nal OKS one)

Canadian Brand NamesNaloxone Hydrochloride Injection®

Pharmacologic CategoryAntidote; Opioid Antagonist

Use: Labeled Indications

Complete or partial reversal of opioid depression, including respiratory depression, induced by natural and synthetic opioids, including heroin, morphine, propoxyphene, methadone, and certain mixed agonist-antagonist analgesics: nalbuphine, pentazocine, and butorphanol

Diagnosis of suspected opioid dependence or acute opioid overdose

Adjunctive agent to increase blood pressure in the management of septic shock

Use: Unlabeled/InvestigationalOpioid-induced pruritus

Use: DentalReverse overdose effects of the two narcotic agents, fentanyl and meperidine, used in the technique of I.V. conscious sedation

Dosing: Adults**Note:** I.M., I.V. (preferred), and SubQ routes are available. Endotracheal administration is the least desirable and is supported by only anecdotal evidence (case report) (ACLS guidelines, 2005):

Opioid intoxication: Respiratory depression: I.V.: 0.4-2 mg; may need to repeat doses every 2-3 minutes; after reversal, may need to readminister dose(s) at a later interval (ie, 20-60 minutes) depending on type/duration of opioid. If no response is observed after 10 mg, consider other causes of respiratory depression. **Note:** Opioid-dependent patients may require lower doses (0.1 mg) titrated incrementally to avoid precipitating acute withdrawal.

Continuous infusion: I.V.: Calculate dosage/hour based on effective intermittent dose used and duration of adequate response seen **or** use $^{2}/_{3}$ of the initial effective naloxone bolus on an hourly basis (typically 0.25-6.25 mg/hour); $^{1}/_{2}$ of the initial bolus dose should be readministered 15 minutes after initiation of the continuous infusion to prevent a drop in naloxone levels; adjust infusion rate as needed to assure adequate ventilation and prevent withdrawal symptoms

Opioid-dependent patients being treated for cancer pain (unlabeled; NCCN guidelines, 2008): I.V.: 0.04-0.08 mg (40-80 mcg) slow I.V. push; administer every 30-60 seconds until improvement in symptoms, if no response is observed after total naloxone dose 1 mg, consider other causes of respiratory depression. **Note:** May dilute 0.4 mg/mL (1 mL) ampule into 9 mL of normal saline for a total volume of 10 mL to achieve a 0.04 mg/mL (40 mcg/mL) concentration.

Postoperative reversal: I.V.: 0.1-0.2 mg every 2-3 minutes until desired response (adequate ventilation and alertness without significant pain). **Note:** Repeat doses may be needed within 1-2 hour intervals depending on type, dose, and timing of the last dose of opioid administered.

Opioid-induced pruritus (unlabeled use): I.V. infusion: 0.25 mcg/kg/hour; **Note:** Monitor pain control; verify that the naloxone is not reversing analgesia.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** I.M., I.V. (preferred), and SubQ routes are available. Endotracheal administration is the least desirable and is supported by only anecdotal evidence (case report) (ACLS guidelines, 2005):

Opiate intoxication: Respiratory depression: I.V.:

Birth (including premature infants) to 5 years or <20 kg: Initial: 0.1 mg/kg (maximum dose: 2 mg) (*Drugs for Pediatric Emergencies*, 1998)

>5 years or ≥20 kg: 2 mg/dose; if no response, repeat every 2-3 minutes (*Drugs for Pediatric Emergencies*, 1998)

Continuous infusion: I.V.: If continuous infusion is required, calculate dosage/hour based on effective intermittent dose used and duration of adequate response seen **or** use $^{2}/_{3}$ of the initial effective naloxone bolus on an hourly basis; titrate dose (typically 0.04-0.16 mg/kg/hour for 2-5 days in children); $^{1}/_{2}$ of the initial bolus dose should be readministered 15 minutes after initiation of the continuous infusion to prevent a drop in naloxone levels; increase infusion rate as needed to assure adequate ventilation and prevent withdrawal symptoms

Postoperative reversal: Infants and Children: I.V.: 0.01 mg/kg; may repeat every 2-3 minutes as needed based on response (adequate ventilation without significant pain)

Administration: I.V.

I.V. push: Administer over 30 seconds as undiluted preparation **or** (unlabeled) administer as diluted preparation slow I.V. push by diluting 0.4 mg (1 mL) ampul with 9 mL of normal saline for a total volume of 10 mL to achieve a concentration of 0.04 mg/mL

I.V. continuous infusion: Dilute to 4 mcg/mL in D_5W or normal saline

Administration: Other

Endotracheal: There is only anecdotal support for this route of administration. May require a slightly higher dose than used in other routes. Dilute to 1-2 mL with normal saline; flush with 5 cc of saline and then administer 5 ventilations

Intratracheal: Dilute to 1-2 mL with normal saline

StorageStore at 25°C (77°F). Protect from light.
ReconstitutionStable in 0.9% sodium chloride and D_5W at 4 mcg/mL for 24 hours.
CompatibilityStable in D_5W, NS; do not mix with alkaline solutions.

Y-site administration: Compatible: Gatifloxacin, linezolid, propofol. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Compatibility in syringe: Compatible: Heparin, ondansetron.

Compatibility when admixed: Compatible: Verapamil.

ContraindicationsHypersensitivity to naloxone or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Acute opioid withdrawal: May precipitate symptoms of acute withdrawal in opioid-dependent patients, including pain, hypertension, sweating, agitation, irritability; in neonates: shrill cry, failure to feed. Carefully titrate dose to reverse hypoventilation; do not fully awaken patient or reverse analgesic effect (postoperative patient).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease or in patients receiving medications with potential adverse cardiovascular effects (eg, hypotension, pulmonary edema or arrhythmias); pulmonary edema and cardiovascular instability, including ventricular fibrillation, have been reported in association with abrupt reversal when using narcotic antagonists. Administration of naloxone causes the release of catecholamines; may precipitate acute withdrawal or unmask pain in those who regularly take opioids.

- Seizures: Use caution in patients with history of seizures; avoid use in treatment of meperidine-induced seizures.

Other warnings/precautions:

- Opioid overdose: Recurrence of respiratory depression is possible if the opioid involved is long-acting; observe patients until there is no reasonable risk of recurrent respiratory depression.

- Postoperative reversal: Appropriate use: Excessive dosages should be avoided after use of opiates in surgery. Abrupt postoperative reversal may result in nausea, vomiting, sweating, tachycardia, hypertension, seizures, and other cardiovascular events (including pulmonary edema and arrhythmias).

Geriatric ConsiderationsIn small trials, naloxone has shown temporary improvement in Alzheimer's disease; however, is not recommended for treatment.
Pregnancy Risk FactorC
Pregnancy ConsiderationsConsider benefit to the mother and the risk to the fetus before administering to a pregnant woman who is known or suspected to be opioid dependent. May precipitate withdrawal in both the mother and fetus.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsNo data reported. Since naloxone is used for opiate reversal the concern should be on opiate drug levels in a breast-feeding mother and transfer to the infant rather than naloxone exposure. The safest approach would be **not** to breast-feed.
Adverse ReactionsAdverse reactions are related to reversing dependency and precipitating withdrawal. Withdrawal symptoms are the result of sympathetic excess. Adverse events occur secondarily to reversal (withdrawal) of narcotic analgesia and sedation.

Central nervous system: Narcotic withdrawal

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersRespiratory rate, heart rate, blood pressure, temperature, level of consciousness, ABGs or pulse oximetry
Nursing: Physical Assessment/MonitoringAssess patient for opioid dependency. Monitor vital signs and cardiorespiratory status continuously during infusion, maintain patent airway.
Patient EducationIf patient is responsive, instructions are individualized. Report respiratory difficulty, palpitations, or tremors. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 0.4 mg/mL (1 mL, 10 mL)

Injection, solution, as hydrochloride [preservative free]: 0.4 mg/mL (1 mL); 1 mg/mL (2 mL)

Generic AvailableYes

Mechanism of ActionPure opioid antagonist that competes and displaces narcotics at opioid receptor sites

Pharmacodynamics/Kinetics

Onset of action: Endotracheal, I.M., SubQ: 2-5 minutes; I.V.: ~2 minutes

Duration: ~30-120 minutes depending on route of administration; I.V. has a shorter duration of action than I.M. administration; since naloxone's action is shorter than that of most opioids, repeated doses are usually needed

Distribution: Crosses placenta

Metabolism: Primarily hepatic via glucuronidation

Half-life elimination: Neonates: 3-4 hours; Adults: 0.5-1.5 hours

Excretion: Urine (as metabolites)

Pharmacotherapy PearlsMay contain methyl and propylparabens

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Cardiovascular ConsiderationsBecause of the very short duration of action of naloxone (20-60 minutes) the reversal of opiate-induced respiratory depression by naloxone may cease while the opiate action persists. Therefore, respiratory depression may recur and patients should continue to be very closely observed. Also note that naloxone reverses the effects of narcotics. Excessive doses of naloxone in the perioperative period may cause an increase in blood pressure and reversal of anesthesia. Furthermore, naloxone may precipitate symptoms of opioid withdrawal (eg, pain, hypertension, irritability) in patients addicted to opioids.

Anesthesia and Critical Care Concerns/Other ConsiderationsNaloxone may contain methyl and propylparabens. Proper steps should be used to prevent use of the incorrect dosage strength. The goal of treatment in the postoperative setting is to achieve reversal of excessive opioid effects without inducing a complete reversal and acute pain.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Naltrexone (Vivitrol™): Injection Site Reactions – August 2008

The U.S. Food and Drug Administration (FDA) is notifying healthcare professionals of reports of serious injection site reactions associated with naltrexone injectable suspension (Vivitrol™). The FDA has received 196 reports of reactions (including cellulitis, induration, hematoma, abscess, and necrosis) following administration. Surgical intervention was required for management of some of the reactions. Instruct patients to report injection site pain, swelling, bruising, pruritus, or redness at the injection site that does not improve (or worsens) within 2 weeks; consider surgical consult for worsening reactions. Naltrexone injectable suspension is for I.M. gluteal administration only, using the provided 1.5 inch 20-gauge administration needle. Alternate treatment should be considered in patients not able to receive an I.M. gluteal injection with the provided needle. Do not administer I.V., SubQ, or into fatty tissue (the risk of serious injection site reaction is increased if given SubQ or into fatty tissue). Patients with higher gluteal fat thickness may be at increased risk for injection site reactions.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#naltrexone

Medication Safety Issues

Sound-alike/look-alike issues:

Naltrexone may be confused with methylnaltrexone, naloxone

ReVia® may be confused with Revatio®, Revex®

Administration issues: Vivitrol™: For intramuscular (I.M.) gluteal injection only

Pronunciation(nal TREKS one)

U.S. Brand NamesDepade®; ReVia®; Vivitrol™

Canadian Brand NamesReVia®

Pharmacologic CategoryAntidote; Opioid Antagonist

Use: Labeled IndicationsTreatment of ethanol dependence; blockade of the effects of exogenously administered opioids

Dosing: Adults

Alcohol dependence (do not give until patient is opioid-free for 7-10 days as required by urinalysis):

Oral: 25 mg; if no withdrawal signs within 1 hour give another 25 mg; maintenance regimen is flexible, variable and individualized (50 mg/day to 100-150 mg 3 times/week for 12 weeks); up to 800 mg/day has been tolerated in a small number of healthy adults without an adverse effect.

I.M.: 380 mg once every 4 weeks

Opioid antidote (do not give until patient is opioid-free for 7-10 days as required by urinalysis): Oral: 25 mg; if no withdrawal signs within 1 hour give another 25 mg; maintenance regimen is flexible, variable and individualized (50 mg/day to 100-150 mg 3 times/week for 12 weeks); up to 800 mg/day has been tolerated in a small number of healthy adults without an adverse effect.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse caution. No adjustment needed in mild impairment. Not adequately studied in moderate-to-severe renal impairment.

Dosing: Hepatic ImpairmentUse caution. An increase in naltrexone AUC of approximately five- and 10-fold in patients with compensated or decompensated liver cirrhosis respectively, compared with normal liver function has been reported No adjustment required with mild-to-moderate hepatic impairment. Not adequately studied in severe hepatic impairment.

Administration: I.M.Vivitrol™ should be administered I.M. into the upper outer quadrant of the gluteal area; use provided 1.5 inch 20-gauge needle for administration. Avoid inadvertent injection into a blood vessel; do not administer I.V., SubQ, or into fatty tissue (the risk of serious injection site reaction is increased if given SubQ or into fatty tissue. Injection should alternate between the two buttocks. Do not substitute any components of the dose-pack.

Administration: OralTo minimize adverse gastrointestinal effects, administer with food or antacids or after meals; advise patient not to self-administer opiates while receiving naltrexone therapy.

Storage

Injection: Store unopened kit at 2°C to 8°C (36°F to 46°F). Kit may be kept at room temperature of ≤25°C (77°F) for ≤7 days prior to use; do not freeze.

Tablet: Store at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to naltrexone or any component of the formulation; narcotic dependence or current use of opioid analgesics; acute opioid withdrawal; failure to pass Narcan® challenge or positive urine screen for opioids; acute hepatitis; liver failure

Warnings/Precautions

Boxed warnings:

- Hepatocellular injury: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Accidental overdose: Patients who had been treated with naltrexone may respond to lower opioid doses than previously used. This could result in potentially life-threatening opioid intoxication. Patients should be aware that they may be more sensitive to lower doses of opioids after naltrexone treatment is discontinued. Warn patients that attempts to overcome opioid blockade could lead to fatal overdose.

- Acute opioid withdrawal: May precipitate symptoms of acute withdrawal in opioid-dependent patients, including pain, hypertension, sweating, agitation, and irritability; in neonates: shrill cry, failure to feed.

- Eosinophilic pneumonia: Cases of eosinophilic pneumonia have been reported; monitor for hypoxia and dyspnea.

- Hepatocellular injury: **[U.S. Boxed Warning]: Dose-related hepatocellular injury is possible; the margin of separation between the apparent safe and hepatotoxic doses appears to be ≤ fivefold.**

- Injection site reactions: Serious injection site reactions (eg, cellulitis, induration, hematoma, abscess, necrosis) have been reported with use. Patients should report injection site pain, swelling, bruising, pruritus, or redness that does not improve (or worsens) within 2 weeks; consider surgical consult for worsening reactions. For I.M. use only, do not administer I.V., SubQ, or into fatty tissue; may increase the risk of injection site reactions.

- Suicidal thoughts/depression: Suicidal thoughts and depression have been reported; monitor closely.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

- Hepatic impairment: Use with caution in patients with hepatic impairment; not studied in severe impairment.

- Renal impairment: Use with caution in patients with renal impairment; not studied in moderate-to-severe impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Vehicle used in injectable (polylactide-co-glycolide microspheres): Has rarely been associated with retinal artery occlusion in patients with abnormal arteriovenous anastomosis (eg, patent foramen ovale).

Other warnings/precautions:

- Detoxified opioid addiction: Patients should be opioid-free for a minimum of 7-10 days; use naloxone challenge test to confirm. Use of naltrexone does not eliminate or diminish withdrawal symptoms.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEvidence of early fetal loss has been observed in animal studies with oral naltrexone. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended

Adverse ReactionsCombined reporting of adverse events from oral and injectable formulations:

>10%:

Cardiovascular: Syncope (13%)

Central nervous system: Headache (25%), insomnia (14%), dizziness (13%), anxiety (12%), somnolence (4%), nervousness, fatigue

Gastrointestinal: Nausea (33%), vomiting (14%), appetite decreased (14%), diarrhea (13%), abdominal pain (11%), abdominal cramping

Local: Injection site reaction (69%; includes bruising, induration, nodules, pain, pruritus, swelling, tenderness)

Neuromuscular & skeletal: Arthralgia (12%), CPK increased (11%)

Respiratory: Upper respiratory tract infection (13%), pharyngitis (11%)

1% to 10%:

Central nervous system: Depression (8%), suicidal thoughts (1%), energy increased, feeling down

Dermatologic: Rash (6%)

Endocrine & metabolic: Polydipsia

Gastrointestinal: Dry mouth (5%)

Genitourinary: Delayed ejaculation, impotency

Hepatic: AST increased (2%)

Neuromuscular & skeletal: Muscle cramps (8%), back pain (6%)

<1% (Limited to important or life-threatening): ALT increased, angina, atrial fibrillation, blood pressure increased, cerebral aneurysm, chest pain, chest tightness, CHF, cholecystitis, cholelithiasis, colitis, COPD, dehydration, delirium, disorientation, DVT, dyspnea, eosinophilic pneumonia, euphoria, GI hemorrhage, hallucinations, hypercholesterolemia, hypersensitivity reaction (includes angioedema and urticaria), hypertension, influenza, ischemic stroke, leukocytosis, lymphadenopathy, MI, narcotic withdrawal, palpitation, paralytic ileus, paranoia, PE, perirectal abscess, pneumonia, pyrexia, rigors, seizure, suicide attempts, tachycardia, thrombocytopenia, tooth abscess, UTI

Drug InteractionsThere are no known significant interactions.

Test InteractionsMay cause cross-reactivity with some opioid immunoassay methods.

Monitoring ParametersFor narcotic withdrawal; liver function tests; injection site reactions

Nursing: Physical Assessment/MonitoringDo not use until patient has been opioid-free for 7-10 days. Assess carefully for several days following start of therapy for narcotic withdrawal symptoms or severe adverse reactions. Monitor injection site for reaction. Use non-narcotic analgesics for pain. Monitor for suicide ideation. Assess results of laboratory tests. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic LFTs

Patient EducationThis medication will help you achieve abstinence from opiates if taken as directed. Do not increase or change dose. Do not use opiates or any medications not approved by your prescriber during naltrexone therapy. Carry documentation to alert medical personnel you are taking medication in the event of an emergency. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); trouble sleeping; decreased appetite; abdominal cramping, nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); low energy; or decreased sexual function (reversible when drug is discontinued). Report yellowing of skin or eyes, change in color of stool or urine, thoughts of suicide, increased perspiration or chills, acute headache, palpitations, unusual joint pain, signs and symptoms of pneumonia (trouble breathing, coughing, or wheezing), or injection site pain, swelling, or unresolved redness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablets (ReVia)

50 mg (30): $248.19

Mechanism of ActionNaltrexone (a pure opioid antagonist) is a cyclopropyl derivative of oxymorphone similar in structure to naloxone and nalorphine (a morphine derivative); it acts as a competitive antagonist at opioid receptor sites, showing the highest affinity for mu receptors.

Pharmacodynamics/Kinetics

Duration: Oral: 50 mg: 24 hours; 100 mg: 48 hours; 150 mg: 72 hours; I.M.: 4 weeks

Absorption: Oral: Almost complete

Distribution: V_d: 19 L/kg; widely throughout the body but considerable interindividual variation exists

Protein binding: 21%

Metabolism: Noncytochrome-mediated dehydrogenase conversion to 6-beta-naltrexol and related minor metabolites; Oral: Extensive first-pass effect

Half-life elimination: Oral: 4 hours; 6-beta-naltrexol: 13 hours; I.M.: naltrexone and 6-beta-naltrexol: 5-10 days

Time to peak, serum: Oral: ~60 minutes; I.M.: Biphasic: 2 hours (first peak), 2-3 days (second peak)

Excretion: Primarily urine (as metabolites and unchanged drug)

Related Information

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(NAN droe lone)

Canadian Brand NamesDeca-Durabolin®; Durabolin®

Pharmacologic CategoryAndrogen

Use: Labeled IndicationsControl of metastatic breast cancer; management of anemia of renal insufficiency

Dosing: Adults

Breast cancer, male/female (phenpropionate): I.M.: 50-100 mg/week

Anemia of renal insufficiency (decanoate): I.M.:

Male: 100-200 mg/week

Female: 50-100 mg/week

Note: Deep I.M. (into gluteal muscle)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDeep I.M. (into gluteal muscle): Children 2-13 years (decanoate): 25-50 mg every 3-4 weeks

Administration: I.M.Inject deeply I.M., preferably into the gluteal muscle.

RestrictionsC-III

ContraindicationsHypersensitivity to nandrolone or any component of the formulation; carcinoma of breast or prostate; nephrosis; pregnancy; not for use in infants

Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Boxed warnings:

- Blood lipid changes: See “Concerns related to adverse effects” below.
- Hepatic effects: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Blood lipid changes: **[U.S. Boxed Warning]: Anabolic steroids may cause blood lipid changes with increased risk of arteriosclerosis.**
- Hepatic effects: **[U.S. Boxed Warning]: Anabolic steroids may cause peliosis hepatis or liver cell tumors which may not be apparent until liver failure or intra-abdominal hemorrhage develops.**

Disease-related concerns:

- Breast cancer: Use with caution in patients with breast cancer; may cause hypercalcemia by stimulating osteolysis.
- Diabetes: Use with caution in patients with diabetes mellitus; monitor carefully.
- Edematous conditions: Use with caution in patients with conditions influenced by edema (eg, cardiovascular disease, migraine, seizure disorder, renal impairment); may cause fluid retention.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Elderly: Use with caution in elderly patients, they may be at greater risk for prostatic hyperplasia, fluid retention, and transaminase elevations.
- Pediatrics: May accelerate bone maturation without producing compensatory gain in linear growth in children; in prepubertal children perform radiographic examination of the hand and wrist every 6 months to determine the rate of bone maturation and to assess the effect of treatment on the epiphyseal centers.
- Women: Discontinue with evidence of mild virilization in women.

Pregnancy Risk FactorX

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

Male:

Postpubertal:

>10%:

Dermatologic: Acne

Endocrine & metabolic: Gynecomastia

Genitourinary: Bladder irritability, priapism

1% to 10%:

Central nervous system: Insomnia, chills

Endocrine & metabolic: Decreased libido, hepatic dysfunction

Gastrointestinal: Nausea, diarrhea

Genitourinary: Prostatic hyperplasia (elderly)

Hematologic: Iron-deficiency anemia, suppression of clotting factors

<1%: Hepatic necrosis, hepatocellular carcinoma

Prepubertal:

>10%:

Dermatologic: Acne

Endocrine & metabolic: Virilism

1% to 10%:

Central nervous system: Chills, insomnia

Dermatologic: Hyperpigmentation

Gastrointestinal: Diarrhea, nausea

Hematologic: Iron deficiency anemia, suppression of clotting

<1%: Hepatocellular carcinoma, necrosis

Female:

>10%: Endocrine & metabolic: Virilism

1% to 10%:

Central nervous system: Chills, insomnia

Endocrine & metabolic: Hypercalcemia

Gastrointestinal: Nausea, diarrhea

Hematologic: Iron deficiency anemia, suppression of clotting factors

Hepatic: Hepatic dysfunction

<1%: Hepatic necrosis, hepatocellular carcinoma

Drug Interactions

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsAltered glucose tolerance tests

Nursing: Physical Assessment/MonitoringUse caution is presence of cardiac, renal, or hepatic disease or epilepsy. Assess potential for interactions with other pharmacological agents. Assess results of LFTs, therapeutic effectiveness (according to purpose of use), and adverse response on a regular basis (adverse reactions may differ according to gender and age). Caution patients with diabetes to monitor serum glucose closely (may increase the effect of hypoglycemic agents). Teach patient possible side effects/appropriate interventions and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with barrier contraceptive use.

Monitoring: Lab TestsLFTs on a regular basis

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be given injection. Report immediately any redness, swelling, burning, or pain at injection site. If you have diabetes, monitor serum glucose closely and notify prescriber of significant changes (nandrolone may increase the effect of insulin and oral hypoglycemic agents). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, yogurt may help). **Male:** Acne, swelling of breasts, loss of libido, impotence. **Female:** Virilism, menstrual irregularity (usually reversible). Report changes in menstrual pattern; enlarged or painful breasts; deepening of voice or unusual growth of body hair; fluid retention (eg, swelling of ankles, feet, or hands, respiratory difficulty, or sudden weight gain); bladder irritability; unresolved CNS changes (eg, nervousness, chills, insomnia); change in color of urine or stool; yellowing of eyes or skin; unusual bruising or bleeding; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as decanoate [in sesame oil]: 100 mg/mL (2 mL); 200 mg/mL (1 mL) [contains benzyl alcohol] [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Oil (Nandrolone Decanoate)

200 mg/mL (25): $416.50

Mechanism of ActionPromotes tissue-building processes, increases production of erythropoietin, causes protein anabolism; increases hemoglobin and red blood cell volume

Pharmacodynamics/Kinetics

Onset of action: 3-6 months

Duration: Up to 30 days

Absorption: I.M.: 77%

Metabolism: Hepatic

Excretion: Urine

Pharmacotherapy PearlsBoth phenpropionate and decanoate are injections in oil.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsNandrolone Decanoate; Nandrolone Phenpropionate

Medication Safety Issues

Sound-alike/look-alike issues:

Visine® may be confused with Visken®

Pronunciation(naf AZ oh leen & fen NIR a meen)

U.S. Brand NamesNaphcon-A® [OTC]; Opcon-A® [OTC]; Visine-A® [OTC]

Canadian Brand NamesNaphcon-A®; Visine® Advanced Allergy

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation; Ophthalmic Agent, Vasoconstrictor

Use: Labeled IndicationsTreatment of ocular congestion, irritation, and itching

Dosing: AdultsOphthalmic: 1-2 drops up to 4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricOphthalmic: Children ≥6 years: Refer to adult dosing.

ContraindicationsHypersensitivity to naphazoline, pheniramine, or any component of the formulation

Warnings/Precautions

Other warnings/precautions:

- OTC labeling: Not for use >72 hours. Notify healthcare provider of eye pain or vision changes. Not recommended for use in patients with cardiovascular disease, hypertension, narrow-angle glaucoma, or children <6 years of age. Not for use with contact lenses.

Geriatric ConsiderationsEvaluate patient's ability to self-administer; use cautiously in patients with cardiovascular disease.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Ocular: Pupillary dilation, increase in intraocular pressure

Systemic effects due to absorption:

Cardiovascular: Hypertension, cardiac irregularities

Endocrine & metabolic: Hyperglycemia

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic:

Naphcon-A®: Naphazoline hydrochloride 0.025% and pheniramine maleate 0.3% (5 mL) [contains benzalkonium chloride; 2 bottles/box], (15 mL) [contains benzalkonium chloride]

Opcon-A®: Naphazoline hydrochloride 0.027% and pheniramine maleate 0.3% (15 mL) [contains benzalkonium chloride]

Jump To Field (Select Field Name)

Pronunciation(naf AZ oh leen)

U.S. Brand NamesAK-Con™; Albalon® [DSC]; Clear eyes® for Dry Eyes and ACR Relief [OTC]; Clear eyes® for Dry Eyes and Redness Relief [OTC]; Clear eyes® Redness Relief [OTC]; Clear eyes® Seasonal Relief [OTC]; Naphcon® [OTC]; Privine® [OTC]

Canadian Brand NamesNaphcon Forte®; Vasocon®

Pharmacologic CategoryAlpha$_1$ Agonist; Imidazoline Derivative; Ophthalmic Agent, Vasoconstrictor

Use: Labeled IndicationsTopical ocular vasoconstrictor; temporary relief of nasal congestion associated with the common cold, upper respiratory allergies or sinusitis; relief of redness of the eye due to minor irritation

Dosing: Adults

Nasal congestion (decongestant): Nasal: 0.05%, instill 1-2 drops or sprays every 6 hours if needed; therapy should not exceed 3 days

Decrease in eye redness (vasoconstrictor): Ophthalmic:

> 0.1% (prescription): 1-2 drops into conjuctival sac every 3-4 hours as needed
>
> 0.012% or 0.025% (OTC): 1-2 drops into affected eye(s) up to 4 times a day; therapy should not exceed 3 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Nasal congestion (decongestant):** Intranasal: Children >12 years: Refer to adult dosing.

Administration: OtherOphthalmic: Contact lenses should be removed prior to administering products containing benzalkonium chloride.

StorageStore at controlled room temperature.

ContraindicationsHypersensitivity to naphazoline or any component of the formulation; narrow-angle glaucoma

Warnings/Precautions

Concerns related to adverse effects:

- Rebound nasal congestion: May occur with extended use.

Disease-related concerns:

- Asthma: Use with caution in patients with chronic asthma.
- Cardiovascular disease: Use with caution in patients with hypertension, heart failure, or coronary artery disease.
- Cerebral arteriosclerosis: Use with caution in patients with cerebral arteriosclerosis.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Infection/injury: Use with caution in patients with local infection or injury.
- Prostatic hyperplasia: Use with caution in patients with benign prostatic hyperplasia.

Concurrent drug therapy issues:

- MAO inhibitors: Avoid concurrent use with MAO inhibitors; may cause hypertensive crisis.

Special populations:

- Pediatrics: Not recommended for use in children <6 years of age; may cause CNS depression, coma and marked reduction in body temperature, especially in infants.

Dosage form specific issues:

- Benzalkonium chloride: Ophthalmic products may contain benzalkonium chloride which may be absorbed by soft contact lenses.

Other warnings/precautions:

- OTC labeling: Patients should notify healthcare provider if symptoms last >72 hours or if condition worsens. In addition with ophthalmic products, contact prescriber in case of eye pain or if changes in vision occur.

Geriatric ConsiderationsEvaluate patient's ability to self-administer; use cautiously in patients with cardiovascular disease.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac irregularities, hypertension

Central nervous system: Body temperature decreased, dizziness, drowsiness, headache, nervousness

Endocrine & metabolic: Hyperglycemia

Gastrointestinal: Nausea

Local: Transient stinging, nasal mucosa irritation, dryness, rebound congestion

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, discomfort, intraocular pressure increased, irritation, lacrimation, mydriasis, punctuate keratitis, redness

Respiratory: Sneezing

Miscellaneous: Diaphoresis

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Pronunciation(na PROKS en & soo doe e FED rin)

U.S. Brand NamesAleve® Cold & Sinus [OTC] [DSC]; Aleve® Sinus & Headache [OTC] [DSC]; Aleve®-D Sinus & Cold [OTC]; Aleve®-D Sinus & Headache [OTC]

Pharmacologic CategoryDecongestant/Analgesic

Use: Labeled IndicationsTemporary relief of cold, sinus, and flu symptoms (including nasal congestion, sinus congestion/pressure, headache, minor body aches and pains, and fever)

Dosing: Adults**Cold, sinus, and flu symptoms (Aleve®-D Cold & Sinus, Aleve®-D Sinus & Headache):** Oral: One caplet every 12 hours (maximum dose: 2 caplets/24 hours); treatment for >10 days is not recommended unless directed by healthcare provider.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cold, sinus, and flu symptoms:** Children ≥12 years: Refer to adult dosing.

Administration: OralDo not crush or chew; swallow whole. Drink a full glass of water with each dose. May administer with food or milk if upset stomach occurs.

Dietary ConsiderationsDrink a full glass of water with each dose. May take with food or milk if upset stomach occurs.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to pseudoephedrine, naproxen, aspirin, other NSAIDs, or any component of the formulation; during or within 14 days of MAO inhibitor therapy; immediately prior to or after coronary artery bypass graft (CABG) surgery

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.

- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.

- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.

- Cardiovascular events: NSAIDs are associated with an increased risk of adverse cardiovascular events, including MI, stroke, and new onset or worsening of pre-existing hypertension. Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation. These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: Use is contraindicated immediately prior to or after coronary artery bypass graft (CABG) surgery. Risk of MI and stroke may be increased with use following CABG surgery.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or urinary obstruction.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

- Thyroid disease: Use with caution in patients with thyroid disease.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.
- Pediatrics: Safety and efficacy of this combination product have not been established in children <12 years of age.

Other warnings/precautions:

- Self-medication (OTC use): Prior to self-medication, patients should contact healthcare provider if they have had recurring heartburn, stomach pain or upset, ulcers, bleeding problems, high blood pressure, heart or kidney disease, thyroid disease, diabetes, glaucoma, enlarged prostate, other serious medical problems, are currently taking a diuretic, aspirin, anticoagulant, or are ≥60 years of age. Recommended dosages should not be exceeded, due to an increased risk of GI bleeding. Stop use and consult a healthcare provider if symptoms get worse, newly appear, or continue; if an allergic reaction occurs; if nervousness, dizziness, or sleeplessness occurs; if having difficulty swallowing, or if fever lasts for >3 days, congestion lasts for >7 days, or pain >10 days. Consuming ≥3 alcoholic beverages/day or taking longer than recommended may increase the risk of GI bleeding.

Pregnancy ConsiderationsSee individual agents.
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsNaproxen: **Substrate** (minor) of CYP1A2, 2C9
Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Naproxen absorption rate/levels may be decreased if taken with food. Onset of effect may be delayed if pseudoephedrine is taken with food.

Herb/Nutraceutical: *Naproxen:* Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity). *Pseudoephedrine:* Avoid ephedra, yohimbe (may cause hypertension).

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet, extended release:

Aleve® Cold & Sinus [DSC], Aleve® Sinus & Headache [DSC], Aleve®-D Sinus & Cold, Aleve®-D Sinus & Headache: Naproxen sodium 220 mg [equivalent to naproxen 200 mg and sodium 20 mg] and pseudoephedrine hydrochloride 120 mg

Generic AvailableNo

ManufacturerBayer HealthCare

Mechanism of Action

Naproxen: Reversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pseudoephedrine: Directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Naproxen
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

NSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response.

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, confusion, insomnia, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 2 weeks of discontinuing an MAO inhibitor. May decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels.

Index TermsNaproxen Sodium and Pseudoephedrine; Pseudoephedrine and Naproxen

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Naproxen may be confused with Natacyn®, Nebcin®

Aleve® may be confused with Alesse®

Anaprox® may be confused with Anaspaz®, Avapro®

Naprelan® may be confused with Naprosyn®

Naprosyn® may be confused with Naprelan®, Natacyn®, Nebcin®

International issues:

Flogen® [Mexico] may be confused with Flovent® which is a brand name for fluticasone in the U.S.

Flogen® [Mexico] may be confused with Floxin® which is a brand name for ofloxacin in the U.S.

Pronunciation(na PROKS en)

U.S. Brand NamesAleve® [OTC]; Anaprox®; Anaprox® DS; EC-Naprosyn®; Mediproxen [OTC]; Midol® Extended Relief; Naprelan®; Naprosyn®; Pamprin® Maximum Strength All Day Relief [OTC]

Canadian Brand NamesAnaprox®; Anaprox® DS; Apo-Napro-Na DS®; Apo-Napro-Na®; Apo-Naproxen EC®; Apo-Naproxen SR®; Apo-Naproxen®; Gen-Naproxen EC; Naprosyn®; Naxen®; Naxen® EC; Novo-Naproc EC; Novo-Naprox; Novo-Naprox Sodium; Novo-Naprox Sodium DS; Novo-Naprox SR; Nu-Naprox; PMS-Naproxen EC; Pro-Naproxen EC; Riva-Naproxen; Sab-Naproxen

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsManagement of ankylosing spondylitis, osteoarthritis, and rheumatoid disorders (including juvenile rheumatoid arthritis); acute gout; mild-to-moderate pain; tendonitis, bursitis; dysmenorrhea; fever

Use: DentalManagement of pain and swelling

Dosing: Adults**Note:** Dosage expressed as naproxen base; 200 mg naproxen base is equivalent to 220 mg naproxen sodium.

Gout, acute: Oral: Initial: 750 mg, followed by 250 mg every 8 hours until attack subsides. **Note:** EC-Naprosyn® is not recommended.

Migraine, acute (unlabeled use): Initial: 500-750 mg; an additional 250-500 mg may be given if needed (maximum: 1250 mg in 24 hours). **Note:** EC-Naprosyn® is not recommended.

Pain (mild-to-moderate), dysmenorrhea, acute tendonitis, bursitis: Oral: Initial: 500 mg, then 250 mg every 6-8 hours; maximum: 1250 mg/day naproxen base

Rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis: 500-1000 mg/day in 2 divided doses; may increase to 1.5 g/day of naproxen base for limited time period

OTC labeling: Pain/fever:

Adults ≤65 years: 200 mg naproxen base every 8-12 hours; if needed, may take 400 mg naproxen base for the initial dose; maximum: 600 mg naproxen base/24 hours

Adults >65 years: Refer to elderly dosing.

Dosing: ElderlyRefer to adult dosing and Geriatric Considerations.

OTC labeling: Pain/fever: Adults >65 years: 200 mg naproxen base every 12 hours

Dosing: Pediatric**Note:** Dosage expressed as naproxen base; 200 mg naproxen base is equivalent to 220 mg naproxen sodium.

Juvenile arthritis: Oral: Children >2 years: 10 mg/kg/day in 2 divided doses

OTC labeling: Pain/fever: Oral: Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: use is not recommended.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister with food, milk, or antacids to decrease GI adverse effects

Suspension: Shake suspension well before administration.

Tablet, extended release: Swallow tablet whole; do not break, crush, or chew.

Dietary ConsiderationsDrug may cause GI upset, bleeding, ulceration, perforation; take with food or milk to minimize GI upset.

StorageStore oral suspension and tablet at 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to naproxen, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.
- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.
- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.
- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age. Not for self-medication (OTC use) in children <12 years of age.

Other warnings/precautions:

- Self-medication (OTC use): Prior to self-medication, patients should contact healthcare provider if they have had recurring stomach pain or upset, ulcers, bleeding problems, high blood pressure, heart or kidney disease, other serious medical problems, are currently taking a diuretic, or are ≥60 years of age. Recommended dosages should not be exceeded, due to an increased risk of GI bleeding. Consuming ≥3 alcoholic beverages/day or taking longer than recommended may increase the risk of GI bleeding.

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high-dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Adverse Reactions

1% to 10%:

Cardiovascular: Edema (3% to 9%), palpitation (<3%)

Central nervous system: Dizziness (3% to 9%), drowsiness (3% to 9%), headache (3% to 9%), lightheadedness (<3%), vertigo (<3%)

Dermatologic: Pruritus (3% to 9%), skin eruption (3% to 9%), ecchymosis (3% to 9%), purpura (<3%), rash

Endocrine & metabolic: Fluid retention (3% to 9%)

Gastrointestinal: Abdominal pain (3% to 9%), constipation (3% to 9%), nausea (3% to 9%), heartburn (3% to 9%), diarrhea (<3%), dyspepsia (<3%), stomatitis (<3%), flatulence, gross bleeding/perforation, indigestion, ulcers, vomiting

Genitourinary: Abnormal renal function

Hematologic: Hemolysis (3% to 9%), ecchymosis (3% to 9%), anemia, bleeding time increased

Hepatic: LFTs increased

Ocular: Visual disturbances (<3%)

Otic: Tinnitus (3% to 9%), hearing disturbances (<3%)

Respiratory: Dyspnea (3% to 9%)

Miscellaneous: Diaphoresis (<3%), thirst (<3%)

<1%: Agranulocytosis, alopecia, anaphylactic/anaphylactoid reaction, angioneurotic edema, arrhythmia, aseptic meningitis, asthma, blurred vision, cognitive dysfunction, colitis, coma, confusion, CHF, conjunctivitis, cystitis, depression, dream abnormalities, dysuria, eosinophilia, eosinophilic pneumonitis, erythema multiforme, exfoliative dermatitis, glossitis, granulocytopenia, hallucinations, hematemesis, hepatitis, hyper-/hypoglycemia, hyper-/hypotension, infection, interstitial nephritis, melena, jaundice, leukopenia, liver failure, lymphadenopathy, menstrual disorders, malaise, MI, muscle weakness, myalgia, oliguria, pancreatitis, pancytopenia, paresthesia, photosensitivity, pneumonia, polyuria, proteinuria, pyrexia, rectal bleeding, renal failure, renal papillary necrosis, respiratory depression, sepsis, Stevens-Johnson syndrome, tachycardia, seizure, syncope, thrombocytopenia, toxic epidermal necrolysis ulcerative stomatitis, vasculitis

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2C9

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Naproxen absorption rate/levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsNaproxen may interfere with 5-HIAA urinary assays; due to an interaction with m-dinitrobenzene, naproxen should be discontinued 72 hours before adrenal function testing if the Porter-Silber test is used.

Monitoring ParametersOccult blood loss, periodic liver function test, CBC, BUN, serum creatinine; urine output

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, GI effects, hepatotoxicity, or ototoxicity) at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who develop eye complaints during long-term NSAID therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic liver function, CBC, BUN, serum creatinine

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience drowsiness, dizziness, lightheadedness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or fluid retention (weigh yourself weekly and report unusual [3-5 lb/week] weight gain), GI bleeding, ulceration, or perforation can occur with or without pain; or discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen extremities; skin rash or itching; acute fatigue; or changes in eyesight (double vision, color changes, blurred vision), hearing, or ringing in ears. **Pregnancy/breast-feeding precautions:** Notify prescriber if you are or intend to become pregnant. Do not take this drug during last trimester of pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, as sodium: 220 mg [equivalent to naproxen 200 mg and sodium 20 mg]

Aleve®, Midol® Extended Relief, Pamprin® Maximum Strength All Day Relief: 220 mg [equivalent to naproxen 200 mg and sodium 20 mg]

Capsule, liquid gel, as sodium:

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Analgesic: 1 hour; Anti-inflammatory:~2 weeks

Peak effect: Anti-inflammatory: 2-4 weeks

Duration: Analgesic: ≤7 hours; Anti-inflammatory: ≤12 hours

Absorption: Almost 100%

Protein binding: >99%; increased free fraction in elderly

Half-life elimination: Normal renal function: 12-17 hours; End-stage renal disease: No change

Time to peak, serum: 1-4 hours

Excretion: Urine (95%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Naproxen and naproxen sodium have the potential to interfere with the antiplatelet effect of low-dose aspirin. One study of naproxen and low-dose aspirin has suggested that naproxen may interfere with aspirin's antiplatelet activity when they are coadministered (Steinhubl, 2005). However, naproxen 500 mg administered 2 hours before or after aspirin 100 mg did not interfere with aspirin's antiplatelet effect. The FDA stated that there is no data looking at doses of naproxen <500 mg. Naproxen over-the-counter strength is 220 mg tablets.

The FDA has warned that ibuprofen can interfere with the antiplatelet effect of low-dose aspirin (81 mg/day), potentially rendering aspirin less effective when used for cardioprotection and stroke protection. In situations where these drugs could be used concomitantly, the FDA has proved the following information: Patients who use immediate release aspirin (not enteric-coated aspirin) and take single doses of ibuprofen 400 mg, should dose the ibuprofen at least 30 minutes or longer after aspirin ingestion or more than 8 hours before aspirin ingestion to avoid attenuation of aspirin's effect. Similar recommendations may hold for concomitant may hold for concomitant naproxen and aspirin use.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause drowsiness, confusion, insomnia, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other Considerations The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients. Should not be used to treat perioperative pain after coronary bypass surgery (CABG).

Medication Safety Issues

Sound-alike/look-alike issues:

Amerge® may be confused with Altace®, Amaryl®

Pronunciation(NAR a trip tan)

U.S. Brand NamesAmerge®

Canadian Brand NamesAmerge®

Pharmacologic CategoryAntimigraine Agent; Serotonin $5\text{-HT}_{1B, 1D}$ Receptor Agonist

Use: Labeled IndicationsTreatment of acute migraine headache with or without aura

Dosing: Adults**Migraine:** Oral: 1 mg to 2.5 mg at the onset of headache. It is recommended to use the lowest possible dose to minimize adverse effects. If headache returns or dose not fully resolve, the dose may be repeated after 4 hours. Do not exceed 5 mg in 24 hours.

Dosing: ElderlyNot recommended for use in the elderly.

Dosing: Renal Impairment

Cl_{cr} 18-39 mL/minute: Initial: 1 mg; do not exceed 2.5 mg in 24 hours.

Cl_{cr} <15 mL/minute: Do not use.

Dosing: Hepatic ImpairmentContraindicated in patients with severe liver failure. The maximum dose is 2.5 mg in 24 hours for patients with mild or moderate liver failure. The recommended starting dose is 1 mg.

Calculations

- Creatinine Clearance: Adults

Administration: OralDo **not** crush or chew tablet; swallow whole with water.

ContraindicationsHypersensitivity to naratriptan or any component of the formulation; cerebrovascular, peripheral vascular disease (ischemic bowel disease), ischemic heart disease (angina pectoris, history of myocardial infarction, or proven silent ischemia); or in patients with symptoms consistent with ischemic heart disease, coronary artery vasospasm, or Prinzmetal's angina; uncontrolled hypertension or patients who have received within 24 hours another 5-HT agonist (sumatriptan, zolmitriptan) or ergotamine-containing product; patients with known risk factors associated with coronary artery disease; patients with severe hepatic or renal disease (Cl_{cr} <15 mL/minute); do not administer naratriptan to patients with hemiplegic or basilar migraine

Allergy Considerations

- Serotonin $5\text{-HT}_{1B,1D}$ Receptor Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac events: Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT_1 agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.

- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT_1 agonist administration.

- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension.

- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT_1 agonist.

Disease-related concerns:

- Coronary artery disease: Should not be given to patients who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation “is satisfactory”, first dose should be given in the healthcare provider's office. Periodic evaluation of cardiovascular status should be done in all patients.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce naratriptan's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Other warnings/precautions:

- Appropriate use: Only indicated for treatment of acute migraine; if a patient does not respond to the first dose, the diagnosis of migraine should be reconsidered.

Geriatric ConsiderationsNaratriptan was not studied in patients >65 years of age. Use in elderly patients is not recommended because of the presence of risk factors associated with adverse effects. These include the presence of coronary artery disease, decreased liver or renal function, and the risk of pronounced blood pressure increases.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using naratriptan in pregnant women. Use only if potential benefit to the mother outweighs the potential risk to the fetus. A pregnancy registry has been established to monitor outcomes of women exposed to naratriptan during pregnancy (800-336-2176). In animal studies, administration was associated with embryolethality, fetal abnormalities, and pup mortality and growth retardation. Tremors were observed in the offspring of female rats when exposed to naratriptan late in gestation.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness, drowsiness, malaise/fatigue

Gastrointestinal: Nausea, vomiting

Neuromuscular & skeletal: Paresthesia

Miscellaneous: Pain or pressure in throat or neck

<1% (Limited to important or life-threatening): Coronary artery vasospasm, transient myocardial ischemia, MI, ventricular tachycardia, ventricular fibrillation, palpitation, hypertension, ECG changes (PR prolongation, QT_c prolongation, premature ventricular contractions, atrial flutter, or atrial fibrillation) hypotension, heart murmurs, bradycardia, hyperlipidemia, hypercholesterolemia, hypothyroidism, hyperglycemia, glycosuria, ketonuria, eye hemorrhage, abnormal liver function tests, abnormal bilirubin tests, convulsions, allergic reaction, panic, hallucinations

Drug Interactions

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringAssess for clear diagnosis of migraine and risk factors for CAD prior to beginning therapy. Assess potential for interactions with other pharmacological agents patient may be taking (eg, ergot-containing drugs, SSRIs). Monitor closely, especially after the first dose. Evaluate therapeutic effectiveness and adverse response (eg, drowsiness, nausea/vomiting, paresthesias, hypertension). If no response to first dose, diagnosis of migraine should be re-evaluated. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Do not crush or chew tablet; swallow whole with water. This drug is to be used to reduce your migraine, not to prevent or reduce the number of attacks. If headache returns or is not fully resolved, the dose may be repeated after 4 hours. If you have no relief with first dose, do not take a second dose without consulting prescriber. **Do not exceed 5 mg in 24 hours. Do not take within 24 hours of any other migraine medication without first consulting prescriber.** May cause dizziness, fatigue, or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report immediately any chest pain, palpitations, or rapid heartbeat; tightness in throat or neck; or rash, itching, or hives. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg, 2.5 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Amerge)

1 mg (9): $250.04

2.5 mg (9): $251.69

Mechanism of ActionThe therapeutic effect for migraine is due to serotonin agonist activity

Pharmacodynamics/Kinetics

Onset of action: 30 minutes

Absorption: Well absorbed

Protein binding, plasma: 28% to 31%

Metabolism: Hepatic via CYP

Bioavailability: 70%

Time to peak: 2-3 hours

Excretion: Urine

Related Information

- Antimigraine Drugs: 5-HT1 Receptor Agonists

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, or fatigue; may rarely cause panic reactions or hallucinations

Mental Health: Effects on Psychiatric TreatmentSSRIs may cause hyper-reflexia, weakness, or lack of coordination when used with naratriptan; these combinations should be avoided

Cardiovascular ConsiderationsCoronary vasospasm has been associated with 5-HT$_{1B/1D}$ agonists. These agents are contraindicated in patients with documented ischemic of vasospastic coronary artery disease. Patients with risk factors for CAD may receive these agents, provided a cardiovascular evaluation yields satisfactory evidence that the patient is free of cardiovascular disease. In patients with risk factors for CAD, administration of the initial dose in a medically staffed/equipped facility (ie, physician's office) is recommended. In addition, ECG monitoring after the initial dose should be considered. Patients who acquire risk factors for CAD, or long-term users of agents from this class of medications, should undergo periodic cardiovascular evaluation.

Anesthesia and Critical Care Concerns/Other ConsiderationsNaratriptan should not be used in patients with a history of vasospastic disease, Prinzmetal's angina, or any critical vascular disease.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Natalizumab: Additional Reports of Progressive Multifocal Leukoencephalopathy - August 2008

Two new cases of progressive multifocal leukoencephalopathy (PML) have been reported to the Food and Drug Administration (FDA) by Biogen Idec and Elan, the manufacturer and distributor of natalizumab (Tysabri®). Both cases were noted in European patients and are the first cases reported since the reintroduction of natalizumab since June 2006. PML has been previously reported following the use of natalizumab and its use is contraindicated in patients with a history of PML. As opposed to the previous cases of PML which were associated with natalizumab in conjunction with a beta-interferon, the two new cases were reported in patients on monotherapy for multiple sclerosis. One patient, however, had a history of beta-interferon use.

In the United States, all patients must be enrolled in the Tysabri® Outreach Unified Commitment to Health (TOUCH™) Prescribing Program in order to receive natalizumab. As part of the TOUCH program, patients are monitored closely for the development of opportunistic infections, including PML. Based on the available data, the FDA still believes that the risk of PML is lower with natalizumab monotherapy. Natalizumab should be discontinued in patients where PML is suspected.

Refer to the following FDA website for additional information:http://www.fda.gov/medwatch/safety/2008/safety08.htm#Tysabri2

Natalizumab: Postmarketing Reports of Hepatotoxicity - February 2008; Updated - Hypersensitivity Reactions/Serious Herpes Infections - June 2008

Biogen Idec and Elan and Biogen Idec Canada Inc, in conjunction with the U.S. Food and Drug Administration (FDA) and Health Canada, have issued respective "Dear Healthcare Professional" letters regarding updates to the warnings and precautions section in the labeling of natalizumab (Tysabri®). Labeling updates were prompted by reports of clinically significant liver injury that have occurred in the postmarketing setting. In addition, Health Canada is warning their healthcare professionals of postmarketing reports of hypersensitivity reactions, as well as rare cases of serious herpes infections.

Hepatotoxicity has been reported as early as 6 days after the first dose of Tysabri® and may include transaminase and bilirubin elevation. Some patients have experienced a recurrence of hepatotoxicity with treatment rechallenge. In addition, an analysis of patients exposed to a brief initial course of natalizumab therapy (≤3 treatments) followed by an interruption of therapy (≥3 months), suggests an increased risk for hypersensitivity reactions in association with the reinitiation of therapy. Healthcare professionals should also be aware of rare postmarketing case reports of serious herpes infections associated with the use of natalizumab.

The manufacturer recommends that Tysabri® be discontinued in patients who develop jaundice, other signs of hepatotoxicity, or hypersensitivity reactions. Antibody testing is now recommended in the Canadian labeling for patients who have received brief initial courses of natalizumab therapy followed by an extended interruption in therapy. Patients who develop serious herpes infections should discontinue therapy until successful resolution of the infection.

U.S. Brand NamesTysabri®

Canadian Brand NamesTysabri®

Pharmacologic CategoryGastrointestinal Agent, Miscellaneous; Monoclonal Antibody, Selective Adhesion-Molecule Inhibitor

Use: Labeled Indications

U.S. labeling: Monotherapy for the treatment of relapsing forms of multiple sclerosis; treatment of moderately- to severely-active Crohn's disease

Canada labeling: Treatment of relapsing forms of multiple sclerosis

Dosing: Adults

Multiple sclerosis: I.V.: 300 mg infused over 1 hour every 4 weeks

Crohn's disease: I.V.: 300 mg infused over 1 hour every 4 weeks; discontinue if therapeutic benefit is not observed within initial 12 weeks of therapy

Concomitant use with corticosteroids: For patients who begin treatment while on chronic oral corticosteroids, begin tapering oral steroids when the onset of natalizumab therapeutic benefit is observed; discontinue use if patient cannot be tapered off of oral corticosteroids within 6 months of therapy initiation. If additional concomitant corticosteroids are required and exceed 3 months/year (in addition to initial corticosteroid taper), consider discontinuing therapy.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot studied.

Dosing: Hepatic ImpairmentNot studied. Discontinue use with jaundice or signs/symptoms of hepatic injury.

Administration: I.V.Solution may be warmed to room temperature prior to administration. Diluted solution should be infused over 1 hour; do not administer by I.V. bolus or push. Patients should be closely monitored for signs and symptoms of hypersensitivity during the infusion and for at least 1 hour after the infusion is complete. The infusion should be discontinued if a reaction occurs, and treatment of the reaction should be instituted. Following infusion, flush line with NS.

Administration: I.V. DetailpH: 6.1

StorageStore concentrated solution under refrigeration between 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Do not shake. Following dilution, may store refrigerated for use within up to 8 hours.

ReconstitutionDilute natalizumab 300 mg in NS 100 mL to a final concentration of 2.6 mg/mL. Gently invert to mix; do not shake.

RestrictionsPatients must be enrolled in the Tysabri® Outreach Unified Commitment to Health (TOUCH™) Prescribing Program (800-456-2255) to receive natalizumab (MS-TOUCH™ for multiple sclerosis or CD-TOUCH™ for Crohn’s disease). Healthcare providers must also register with the program in order to prescribe, dispense or administer natalizumab. Treatment must be reauthorized every 6 months. Natalizumab is available only through infusion centers registered with the TOUCH™ program; infusion center information is available at 1-800-456-2255.

Medication guides are available at http://www.fda.gov/cder/Offices/ODS/MG/natalizumabMG.pdf and should be provided to every patient prior to initiation of therapy.

ContraindicationsHypersensitivity to natalizumab, murine proteins, or any component of the formulation; current or history of progressive multifocal leukoencephalopathy (PML)

Canada labeling: Additional contraindications (not in U.S. labeling): Immunocompromised patients as a result of immunosuppressant or antineoplastic therapy, or immunodeficiencies (eg, HIV, leukemia, lymphoma)

Warnings/Precautions

Boxed warnings:

- Progressive multifocal leukoencephalopathy (PML): See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hepatotoxicity: Hepatotoxicity, including transaminase and bilirubin elevation, has been reported with use; may occur as early as 6 days after the first dose; may recur with treatment rechallenge; discontinue use with jaundice or signs/symptoms of hepatic injury.

- Hypersensitivity/infusion-related reactions: During clinical studies, up to 24% of patients experienced an infusion-related reaction; serious systemic hypersensitivity reactions occurred in ≤1% of patients. Severe reactions, including anaphylaxis, may occur rarely. Patients treated with brief initial courses of therapy (≤3 infusions) followed by an extended interruption in therapy (≥3 months) may be at an increased risk for hypersensitivity reactions following reinitiation of therapy. Retreatment is not recommended in patients developing hypersensitivity reactions. Infusion-related reactions may occur more frequently in patients with antibody to natalizumab. Antibody formation (which occurs in about 10% of patients) is associated with a decrease in natalizumab levels and a decrease in the efficacy of natalizumab. The Canadian labeling recommends antibody testing in patients who have received brief initial courses of natalizumab therapy followed by an extended interruption in therapy.

- Infections: Use may be associated with an increased risk of infections, including opportunistic infections and serious herpes infections (rare, postmarketing reports; concurrent use of antineoplastic, immunosuppressant [including short-course corticosteroids], or immunomodulating agents may increase this risk). In the presence of a serious herpes infection, discontinue therapy until successful resolution of the infection.

- Progressive multifocal leukoencephalopathy (PML): **[U.S. Boxed Warning]: Increased risk of developing fatal or disabling PML (an opportunistic infection caused by the JC virus); patients must be routinely monitored for signs of PML with baseline and periodic MRI evaluations; access to and provision of therapy requires registration of patients and healthcare providers with the TOUCH™ prescribing program;** concurrent immunomodulator therapy or immunosuppression may be risk factors for the development of PML, however, PML has also been reported with natalizumab monotherapy. A brain MRI scan (baseline) should be obtained prior to initiating therapy in MS patients and should be considered in Crohn’s patients.

Disease-related concerns:

- Crohn’s disease: Natalizumab should not be used in combination with immunosuppressants or tumor necrosis factor (TNF) inhibitors in patients with Crohn’s disease; aminosalicylates may be used concurrently with natalizumab. For patients who begin treatment while on chronic oral corticosteroids, begin tapering oral steroids when the onset of natalizumab therapeutic benefit is observed; discontinue use if patient cannot be tapered off of oral corticosteroids within 6 months of therapy initiation. If additional concomitant corticosteroids are required and exceed 3 months/year (in addition to initial corticosteroid taper), consider discontinuing therapy.

- Depression: Use with caution in patients with a history of depression; closely monitor.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Use should be restricted to patients with inadequate response to or intolerant of other therapies for Crohn's disease or multiple sclerosis.

- Long-term therapy: Safety and efficacy have not been established for therapy >2 years or in chronic progressive multiple sclerosis.

Pregnancy Risk FactorC

Pregnancy Considerations Adverse events have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if clearly needed. Pregnant women exposed to natalizumab should be enrolled in the Tysabri® Pregnancy Exposure Registry (800-456-2255).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding Considerations It is not known whether natalizumab is excreted in human milk. Because many immunoglobulins are secreted in milk and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse Reactions

>10%:

Central nervous system: Headache (32% to 38%), fatigue (10% to 27%), depression (≤19%)

Dermatologic: Rash (6% to 12%)

Gastrointestinal: Nausea (≤17%), gastroenteritis (≤11%), abdominal discomfort (≤11%)

Genitourinary: Urinary tract infection (3% to 21%)

Neuromuscular & skeletal: Arthralgia (8% to 19%), extremity pain (16%), back pain (≤12%)

Respiratory: Upper respiratory infection (≤22%), lower respiratory infection (≤17%)

Miscellaneous: Infusion-related reaction (11% to 24%), influenza (≤12%), flu-like syndrome (≤11%)

1% to 10%:

Cardiovascular: Peripheral edema (5% to 6%), chest discomfort (≤5%)

Central nervous system: Vertigo (≤6%), dysesthesia (3%), syncope (≤2%), somnolence (≤2%)

Dermatologic: Dermatitis (≤7%), pruritus (≤4%), urticaria (≤2%), dry skin (≤1%)

Endocrine & metabolic: Menstrual irregularities (≤5%), dysmenorrhea (2% to 6%), amenorrhea (≤2%), ovarian cyst (≤2%)

Gastrointestinal: Diarrhea (10%), dyspepsia (≤5%), abdominal pain (≤4%), constipation (≤4%), flatulence (≤3%), aphthous stomatitis (≤2%), weight changes (≤2%), cholelithiasis (≤1%), gingival infection (1%)

Genitourinary: Vaginitis/vaginal infections (4% to 10%), urinary frequency (≤9%), urinary incontinence (≤4%)

Hematologic: Hematoma (1%)

Hepatic: Transaminase increased (≤5%)

Local: Bleeding at injection site (≤3%)

Neuromuscular & skeletal: Muscle cramp (≤5%), tremor (1% to 3%), rigors (≤3%), joint swelling (≤2%)

Respiratory: Sinusitis (≤8%), cough (≤7%), tonsillitis (≤7%), pharyngolaryngeal pain (≤6%), epistaxis (2%)

Miscellaneous: Antibody formation (9% to 10%), tooth infection (≤9%), herpes infection (≤8%), viral infection (≤7%), hypersensitivity reactions (acute: 2% to 4%; serious acute: ≤1%; delayed: ≤5%), toothache (≤4%), serious infection (2% to 3%), night sweats (≤1%)

<1%, postmarketing, and/or case reports: Acne, agitation, anaphylaxis/anaphylactoid reactions, anemia, angina, appendicitis, bilirubin increased, bronchopulmonary aspergillosis, *Burkholderia cepacia*, Crohn's disease exacerbation, cryptosporidial gastroenteritis, cytomegalovirus hepatitis, dizziness, dyspnea, erythema. fever, flushing, hemoglobin decreased (mild, transient), hepatotoxicity, herpes encephalitis, herpes meningitis, hypotension, joint stiffness, lethargy, leukocytosis, nasopharyngitis, opportunistic infections (including progressive multifocal leukoencephalopathy [PML], meningitis, and bronchopulmonary infections), muscle spasms, muscle weakness, onychorrhexis, paresis, petechiae, pharyngitis, *Pneumocystis jiroveci* pneumonia, pneumonia, psychomotor hyperactivity, pulmonary *Mycobacterium avium intracellulare*, suicidal ideation, tachycardia, thrombocytopenia, thrombophlebitis, varicella pneumonia, vasodilatation

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersMonitor for hypersensitivity reactions during, and for 1 hour after, infusion; signs and symptoms of hepatotoxicity (eg, serum transaminases, bilirubin)

Baseline brain MRI scan; if PML is suspected, obtain gadolinium-enhanced brain MRI scan and CSF analysis for JC viral DNA. Evaluate for signs or symptoms of progressive multifocal leukoencephalopathy (focal neurologic deficits, which may present as hemiparesis, visual field deficits, cognitive impairment, aphasia, ataxia, and/or cranial nerve deficits) at 3 and 6 months after first infusion; every 6 months thereafter. **Note:** Transient and reversible leukocytosis (excluding neutrophils) and mildly reduced hemoglobin may occur with treatment and may require ~4 months for return to baseline values after the last dose.

Canadian labeling recommends antibody testing in patients who have received brief initial courses of natalizumab therapy followed by an extended interruption in therapy.

Nursing: Physical Assessment/MonitoringPatient and prescriber must be registered with the Tysabri Outreach Unified Commitment to Health Prescribing Program (TOUCH™). Patient should be monitored closely for infusion-related reactions during and for 1 hour following infusion. If hypersensitivity reaction occurs, infusion should be promptly discontinued; retreatment is not recommended. See Administration and Dosing specifics. Evaluate laboratory tests, effectiveness of treatment (according to indications for use), and adverse effects (hepatotoxicity [jaundice], opportunistic infection [including herpes], excessive fatigue, depression). Provide patient/caregiver with medication guide and teach patient/caregiver possible side effects, appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSigns and symptoms of hepatotoxicity (eg, serum transaminases, bilirubin). Canadian labeling recommends antibody testing in patients who have received brief initial courses of natalizumab therapy followed by an extended interruption in therapy.

Patient EducationThis drug can only be administered by intravenous infusion. You will be monitored closely during and following infusion. Report immediately any skin rash; dizziness; nausea; flushing; difficulty breathing; chest pain; or tightness, redness, swelling, or pain at infusion site. Following infusion, you may experience headache or joint pain (consult prescriber for appropriate analgesic) or unusual fatigue (adequate and frequent rest periods may help). Report immediately any signs of urinary tract infection (itching, pain, discharge); dark urine or altered frequency of urination; lower respiratory infection (cough, difficulty breathing, chest tightness); unusual sores or unhealed sores; chest discomfort or pain; back pain; unusual depression; worsening of symptoms; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or are breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Tysabri®: 300 mg/15 mL (15 mL) [contains polysorbate-80]

Generic AvailableNo

ManufacturerBiogen Idec Inc

Mechanism of ActionNatalizumab is a monoclonal antibody against the alpha-4 subunit of integrin molecules. These molecules are important to adhesion and migration of cells from the vasculature into inflamed tissue. Natalizumab blocks integrin association with vascular receptors, limiting adhesion and transmigration of leukocytes. Efficacy in specific disorders may be related to reduction in specific inflammatory cell populations in target tissues. In multiple sclerosis, efficacy may be related to blockade of T-lymphocyte migration into the central nervous system; treatment results in a decreased frequency of relapse. In Crohn's disease, natalizumab decreases inflammation by binding to alpha-4 integrin, blocking adhesion and migration of leukocytes in the gut.

Pharmacodynamics/Kinetics

Distribution: Crohn's disease: 2.4-8 L; Multiple sclerosis: 3.8-7.6 L

Half-life elimination: Crohn's disease: 3-17 days; Multiple sclerosis: 7-15 days

Pharmacotherapy Pearls

U.S. patients and healthcare providers (eg, pharmacies, physicians) must register with the TOUCH Program (800-456-2255) to ensure the safe and appropriate use of natalizumab. Enrollment in the program insures that participants acknowledge and adhere to the following requirements:

Healthcare providers/prescribers: Ability to diagnose, including management or referral of potential PML complications; educate patients on program enrollment procedures, including risk/benefit of treatment; file appropriate program paperwork with manufacturer; report serious infections to manufacturer and FDA; evaluate patient response to therapy and assess appropriateness of continued treatment.

Patients: Understand medication guide; promptly report worsening symptoms (including hypersensitivity); inform other healthcare providers of their therapy with natalizumab.

Canadian patients are encouraged to enroll in the Canadian Tysabri® Care Program™ (888)-827-2827, a patient registry for those prescribed natalizumab.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause depression, suicidal ideation has been reported; use caution in patients with a history of depression; monitor for depressive symptoms

Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropic agents may produce additive effects; monitor

Index TermsAN100226; Anti-4 Alpha Integrin; IgG4-Kappa Monoclonal Antibody

Medication Safety Issues

Sound-alike/look-alike issues:

Natacyn® may be confused with Naprosyn®

Pronunciation(na ta MYE sin)
U.S. Brand NamesNatacyn®
Canadian Brand NamesNatacyn®
Pharmacologic CategoryAntifungal Agent, Ophthalmic
Use: Labeled IndicationsTreatment of blepharitis, conjunctivitis, and keratitis caused by susceptible fungi (*Aspergillus*, *Candida*, *Cephalosporium*, *Fusarium*, and *Penicillium*)
Dosing: Adults

Fungal keratitis: Ophthalmic: Instill 1 drop in conjunctival sac every 1-2 hours, after 3-4 days reduce to one drop 6-8 times/day; usual course of therapy is 2-3 weeks or until resolution of active fungal keratitis (may be useful to gradually reduce dosage at 4-7 day intervals to assure elimination of organism)

Fungal blepharitis or conjunctivitis: Ophthalmic: Instill 1 drop in conjunctival sac every 4-6 hours

Dosing: ElderlyRefer to adult dosing.
Administration: TopicalOphthalmic: Shake well before using, do not touch dropper to eye.
StorageStore at 2°C to 24°C (36°F to 75°F); do not freeze. Protect from excessive heat and light.
ContraindicationsHypersensitivity to natamycin or any component of the formulation
Warnings/Precautions

Disease-related concerns:

- Epithelial ulceration: Suspension may adhere to epithelial ulcers; retention of the suspension in the fornices occurs regularly.

Special populations:

- Contact lens wearers: Contact lens should not be worn if signs/symptoms of fungal blepharitis, conjunctivitis, and/or keratitis are present. Contains benzalkonium chloride which may be absorbed by contact lenses; remove contact lens prior to administration and wait 15 minutes before reinserting.

Other warnings/precautions:

- Appropriate use: For topical eye use only. Failure to improve (keratitis) after 7-10 days of administration suggests infection caused by a microorganism not susceptible to natamycin; efficacy as a single agent in fungal endophthalmitis has not been established.

Geriatric ConsiderationsAssess patient's ability to self-administer ophthalmic drops.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsPostmarketing and/or case reports: Allergic reaction, chest pain, corneal opacity, dyspnea, eye discomfort, edema, hyperemia, irritation and/or pain, foreign body sensation, parasthesia, tearing, vision changes
Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringMonitor effectiveness of therapy. Teach patient appropriate administration, possible side effects/interventions, and adverse symptoms to report.
Patient EducationThis medication is for ophthalmic use only. Administer exactly as directed for as long as directed. Do not discontinue early without contacting prescriber. Store at room temperature. Shake before using. Wash hands before instilling solution. Sit or lie down to instill. Open eye, gently pull down lower lid, and put drop(s) in inner corner of eye. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Close eye and roll eye in all directions; apply gentle pressure to inner corner of eye. Do not blink for $^{1}/_{2}$ minute. Wipe away excess from skin around eye. May cause sensitivity to bright light (dark glasses may help). Temporary stinging or blurred vision may occur. Report persistent pain, burning, vision changes, swelling, itching, worsening of condition, or lack of improvement in 2-3 weeks. Discontinue medication and contact prescriber immediately if you develop a rash or allergic reaction.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, ophthalmic:

Natacyn®: 5% (15 mL) [contains benzalkonium chloride]

Generic AvailableNo

Mechanism of ActionIncreases cell membrane permeability in susceptible fungi
Pharmacodynamics/Kinetics

Absorption: Ophthalmic: Systemic, <2%; Gastrointestinal: Poor

Distribution: Adheres to cornea, retained in conjunctival fornices; does not produce effective intraocular fluid concentrations

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsPimaricin
International Brand NamesDeronga (DE); Fukricin (ID); Miconacina (MX); Natacyn (AR, MY, PL, SG, TH, TW); Natadrops (IN); Natafucin (GB, IT); Natamycyna (PL); Ophth-natamycin (PK); Pima-Biciron (DE); Pimafucin (BE, CZ, DE, FI, HU, LU, PL, PT)

Nateglinide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(na te GLYE nide)
U.S. Brand NamesStarlix®
Canadian Brand NamesStarlix®
Pharmacologic CategoryAntidiabetic Agent, Meglitinide Derivative
Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as monotherapy when hyperglycemia cannot be managed by diet and exercise alone; in combination with metformin or a thiazolidinedione to lower blood glucose in patients whose hyperglycemia cannot be controlled by exercise, diet, or a single agent alone
Dosing: Adults**Management of type 2 diabetes mellitus:** Oral: Initial and maintenance dose: 120 mg 3 times/day, 1-30 minutes before meals; may be given alone or in combination with metformin or a thiazolidinedione; patients close to Hb A_{1c} goal may be started at 60 mg 3 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo specific dosage adjustment is recommended for patients with mild-to-severe renal disease. Patients on dialysis showed reduced medication exposure and plasma protein binding. Patients with severe renal dysfunction are more susceptible to glucose-lowering effect; use with caution.
Dosing: Hepatic ImpairmentIncreased serum levels are seen with mild hepatic insufficiency; no dosage adjustment is needed. Has not been studied in patients with moderate to severe liver disease; use with caution.
Dietary ConsiderationsNateglinide should be taken 1-30 minutes prior to meals. Scheduled dose should not be taken if meal is missed. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness).
StorageStore at 25°C (77°F).
ContraindicationsHypersensitivity to nateglinide or any component of the formulation; diabetic ketoacidosis, with or without coma (treat with insulin); type 1 diabetes mellitus (insulin dependent, IDDM)
Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: May cause hypoglycemia; appropriate patient selection, dosage, and patient education are important to avoid hypoglycemic episodes.

Disease-related concerns:

- Adrenal/pituitary impairment: Use with caution in patients with adrenal and/or pituitary impairment; may be more susceptible to glucose-lowering effects.
- Hepatic impairment: Use with caution in patients with moderate-to-severe hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment; may be more susceptible to glucose-lowering effects.
- Stress-related states: It may be necessary to discontinue nateglinide and administer insulin if the patient is exposed to stress (ie, fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- Agents stimulating insulin release: Patients not adequately controlled on oral agents which stimulate insulin release (eg, glyburide) should not be switched to nateglinide or have nateglinide added to therapy.
- Metformin: Indicated for adjunctive therapy with metformin; not to be used as a substitute for metformin monotherapy.
- Sulfonylureas: Combination treatment with sulfonylureas is not recommended (no additional benefit).

Special populations:

- Elderly: Use with caution in the elderly; may be more susceptible to glucose-lowering effects.
- Malnourished patients: Use with caution in malnourished patients; may be more susceptible to glucose-lowering effects.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo changes in safety and efficacy were seen in patients ≥65 years; however, some older adults may show increased sensitivity to dosing. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb

A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in animal reproduction studies; therefore, nateglinide is classified as pregnancy category C. Information describing the effects of nateglinide on pregnancy outcomes is limited. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if nateglinide is excreted in breast milk. Breast -feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Nateglinide in Pregnancy & Lactation

Adverse ReactionsAs reported with nateglinide monotherapy:

1% to 10%:

Central nervous system: Dizziness (4%)

Endocrine & metabolic: Hypoglycemia (2%), increased uric acid

Gastrointestinal: Weight gain

Neuromuscular & skeletal: Arthropathy (3%)

Respiratory: Upper respiratory infection (10%)

Miscellaneous: Flu-like syndrome (4%)

Postmarketing and/or case reports: Cholestatic hepatitis, jaundice, liver enzymes increased, rash, pruritus, urticaria

Metabolism/Transport Effects**Substrate** (major) of CYP2C9, 3A4; **Inhibits** CYP2C9 (weak)

Drug Interactions

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (increased risk of hypoglycemia).

Food: Rate of absorption is decreased and time to T_{max} is delayed when taken with food. Food does not affect AUC. Multiple peak plasma concentrations may be observed if fasting. Not affected by composition of meal.

Herb/Nutraceutical: Avoid alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, and stinging nettle (may enhance the hypoglycemic effects of antidiabetic agents). St. John's wort may decrease the levels/effect of nateglinide.

Monitoring ParametersGlucose and Hb A_{1c} levels, weight, lipid profile

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response on a regular basis throughout therapy. Teach patient proper use (or refer patient to diabetic educator), possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report

Monitoring: Lab TestsGlucose and Hb A_{1c} levels, lipid profile

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take this medication exactly as directed, 1-30 minutes before a meal. If you skip a meal (or add an extra meal), skip (or add) a dose for that meal. Do not change dosage or discontinue without first consulting prescriber. Follow dietary and lifestyle recommendations of provider. You will be instructed in signs of hypo- or hyperglycemia by prescriber or diabetic educator; be alert for adverse hypoglycemia (tachycardia, profuse perspiration, tingling of lips and tongue, seizures, or change in sensorium) and follow prescriber's instructions for intervention. Note that unusual strenuous exercise, excessive alcohol intake, or acute reduction in caloric intake may increase risk of hypoglycemia. Persistent nausea or vomiting, or severely decreased dietary intake may increase risk of hyperglycemia. May cause mild side effects during first weeks of therapy (dizziness, weight gain, mild muscle aches or pain, or flu-like symptoms); if these do not diminish, notify prescriber. Report signs of respiratory infection or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Starlix®: 60 mg, 120 mg

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Tablets (Starlix)

60 mg (30): $56.45

120 mg (30): $60.40

Mechanism of ActionA phenylalanine derivative, nonsulfonylurea hypoglycemic agent used in the management of type 2 diabetes mellitus (noninsulin dependent, NIDDM); stimulates insulin release from the pancreatic beta cells to reduce postprandial hyperglycemia; amount of insulin release is dependent upon existing glucose levels

Pharmacodynamics/Kinetics

Onset of action: Insulin secretion: ~20 minutes

Peak effect: 1 hour

Duration: 4 hours

Absorption: Rapid

Distribution: 10 L

Protein binding: 98%, primarily to albumin

Metabolism: Hepatic via hydroxylation followed by glucuronide conjugation via CYP2C9 (70%) and CYP3A4 (30%) to metabolites

Bioavailability: 73%

Half-life elimination: 1.5 hours

Time to peak: ≤1 hour

Excretion: Urine (83%, 16% as unchanged drug); feces (10%)

Related Information

- Diabetes Mellitus Management, Adults

Pharmacotherapy PearlsAn increase in weight was seen in nateglinide monotherapy, which was not seen when used in combination with metformin.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause weight gain; psychotropics may produce additive effects. Beta-blockers and MAO inhibitors may potentiate the hypoglycemic effects of nateglinide. May cause flu-like symptoms; take this into consideration if also concerned about SSRI discontinuation syndrome.

English

Jump To Field (Select Field Name)

Pronunciation(ne BIV oh lole)

U.S. Brand NamesBystolic™

Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective

Use: Labeled IndicationsTreatment of hypertension, alone or in combination with other agents

Use: Unlabeled/InvestigationalHeart failure

Dosing: Adults

Hypertension: Oral: Initial: 5 mg once daily; if initial response is inadequate, may be increased at 2-week intervals to a maximum dose of 40 mg once daily

Heart failure (unlabeled use): Adults ≥70 years: Oral: Initial: 1.25 mg once daily; if tolerated, may increase by 2.5 mg at 1- to 2-week intervals to a maximum dose of 10 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentSevere impairment (Cl_{cr} <30 mL/minute): Initial: 2.5 mg/day; increase cautiously.

Dosing: Hepatic ImpairmentModerate impairment (Child-Pugh class B): Initial: 2.5 mg/day; increase cautiously.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to nebivolol or any component of the formulation; severe bradycardia; heart block greater than first-degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; decompensated cardiac failure; sick sinus syndrome (unless a permanent pacemaker is in place); severe hepatic impairment (Child-Pugh class C)

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to a variety of allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; for patients with bronchospastic disease who do not respond to or cannot tolerate other therapies, initial low doses of beta$_1$-selective nebivolol may be employed and used cautiously with close monitoring. Ensure patient has an inhaled beta$_2$-agonist immediately available.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.

- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition. If condition worsens, consider temporary discontinuation or dosage reduction of nebivolol. Patients should be stabilized on heart failure regimen prior to initiation of beta-blocker. Beta-blocker therapy should be initiated at very low doses with gradual and very careful titration. Adjustment of other medications (ACE inhibitors and/or diuretics) may be required.

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment required with moderate impairment (Child-Pugh class B). Use is contraindicated in patients with Child-Pugh class C hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): Can precipitate or aggravate symptoms of arterial insufficiency in patients with PVD and Raynaud’s disease; use with caution and monitor for progression of arterial obstruction.

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required with severe renal impairment (Cl_{cr}

<30 mL/minute). Nebivolol has not been evaluated in dialysis-dependent patients.

- Thyrotoxicosis: Beta-blockade may mask signs of hyperthyroidism (eg, tachycardia). Abrupt discontinuation may exacerbate symptoms of hyperthyroidism and may also induce thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function (eg, ether, cyclopropane and trichloroethylene).

- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block may occur.

- CYP2D6 Inhibitors: Use with caution in patients receiving CYP2D6 inhibitors (eg, chlorpromazine, fluoxetine, propafenone, propoxyphene, quinidine, ritonavir) (see Drug Interactions).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with coronary artery disease), but gradually tapered over 1-2 weeks to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric Considerations Due to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (eg, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk Factor C (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy Considerations Adverse events were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Beta-blockers have been associated with persistent bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7).

Lactation Excretion in breast milk unknown/not recommended

Breast-Feeding Considerations Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Due to the potential for serious adverse effects (eg, bradycardia, hypotension) in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

1% to 10%:

Cardiovascular: Peripheral edema (1%), bradycardia (≤1%), chest pain (≤1%)

Central nervous system: Headache (6% to 9%), fatigue (dose related; 2% to 5%), dizziness (2% to 4%), insomnia (1%)

Dermatologic: Rash (≤1%)

Endocrine & metabolic: Hypercholesterolemia (≥1%), HDL levels decreased (≥1%), hyperuricemia (≥1%), triglyceride levels increased (≥1%), uric acid levels increased (≥1%)

Gastrointestinal: Diarrhea (dose related; 2% to 3%), nausea (1% to 3%), abdominal pain (≥1%)

Hematologic: Thrombocytopenia (≥1%)

Neuromuscular & skeletal: Paresthesia (≥1%), weakness (≥1%)

Renal: BUN increased (≥1%)

Respiratory: Dyspnea (≤1%)

<1%, postmarketing, and/or case reports: Acute pulmonary edema, acute renal failure, allergic vasculitis, angioedema, AST increased, ALT increased, AV block (second and third degree), bilirubin increased, bronchospasm, claudication, erectile dysfunction, hepatic function abnormal, hypersensitivity reaction, MI, peripheral ischemia, pruritus, psoriasis, Raynaud's phenomenon, skin disorder, somnolence, syncope, urticaria, vertigo, vomiting

Metabolism/Transport Effects **Substrate** of CYP2D6 (major)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may increase antihypertensive effect).

Monitoring ParametersBlood pressure, ECG; neurologic status; serum glucose (in diabetic patients)

Nursing: Physical Assessment/MonitoringMonitor therapeutic response (especially pulse rate and blood pressure) and adverse reactions at the beginning and periodically throughout therapy. Assess other prescription, herbal, and OTC medications the patient may be taking to avoid duplications and interactions. Taper dosage slowly when discontinuing; do not discontinue abruptly. If you have diabetes, this medication may mask the symptoms of hypoglycemia; monitor glucose levels closely. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsSerum glucose (regularly in patients with diabetes)

Patient EducationInform prescriber of all prescription or OTC medications or herbal products you are taking. Do not take any new medications or stop taking this medication without consulting prescriber. If you have diabetes, monitor blood glucose levels closely; may mask the signs of hypoglycemia. May cause postural hypotension. Use caution when climbing stairs or changing position. Report signs of fluid retention (unusual weight gain of >3-5 lb/week, swelling of the extremities); shortness of breath; or chest pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Bystolic™: 2.5 mg, 5 mg, 10 mg

Generic AvailableNo

ManufacturerForest Pharmaceuticals Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Bystolic)

2.5 mg (30): $57.99

5 mg (30): $57.99

10 mg (30): $59.99

Mechanism of ActionHighly-selective inhibitor of beta$_1$-adrenergic receptors; at doses ≤10 mg nebivolol preferentially blocks beta$_1$-receptors. Nebivolol, unlike other beta-blockers, also produces an endothelium-derived nitric oxide-dependent vasodilation resulting in a reduction of systemic vascular resistance.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: V$_d$: 8-12 L/kg

Protein binding: ~98%

Metabolism: Hepatic; via glucuronidation and CYP2D6; extensive first-pass metabolism to multiple active metabolites with variable activity

Bioavailability: ~12% (extensive metabolizers); 96% (poor metabolizers)

Half-life elimination: Terminal: 10-12 hours (extensive metabolizers); 19-32 hours in poor metabolizers

Time to peak, plasma: 0.5-4 hours

Excretion: Urine (38%; 67% in poor metabolizers; <0.5% of unchanged drug); feces (44%; 13% in poor metabolizers; <0.5% of unchanged drug)

Dental Health: Effects on Dental TreatmentNebivolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with nebivolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for nebivolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause CNS depression, fatigue, dizziness, or insomnia

Mental Health: Effects on Psychiatric TreatmentAcetylcholinesterase inhibitors and SSRIs may enhance the bradycardic effect of beta-blockers; monitor. Amphetamines may diminish the antihypertensive effect of beta-blockers. Chlorpromazine, fluoxetine, paroxetine, pergolide, and ropinirole may increase the levels/effects of nebivolol.

Cardiovascular Considerations

Heart Failure: Strong evidence supports that beta-blocker therapy, without intrinsic sympathomimetic activity (ISA), should be initiated in select patients with **stable** heart failure (NYHA Class II-III). To date, carvedilol, sustained release metoprolol, and bisoprolol have demonstrated a beneficial effect on morbidity and mortality. It is important that beta-blocker therapy be instituted initially at very low doses with gradual and very careful titration.

The SENIORS trial evaluated the use of nebivolol versus placebo in 2128 elderly patients (≥70 years) with chronic heart failure. The initial dose of nebivolol was 1.25 mg once daily. If tolerated, nebivolol was increased by 2.5 mg every 1-2 weeks to a maximum dose of 10 mg (reached by 68% of patients). Mean dose achieved during the study was 7.7 mg. Mean duration of follow-up was 21 months. Nebivolol reduced the composite endpoint of all cause mortality or cardiovascular hospital admission (31.1% vs 35.3%, p=0.039) compared to placebo. Nebivolol's effects on all-cause mortality alone, a secondary endpoint, did not reach statistical significance. The authors concluded that nebivolol is an effective and well-tolerated beta-blocker in the treatment of heart failure in the elderly. Future clinical trials should be conducted to determine applicability to other populations with chronic heart failure. Furthermore, comparisons to proven beta-blockers for chronic heart failure are needed.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, post myocardial infarction, high coronary disease risk, or diabetes. In type-2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul. 2006; Yang, 2006).

Nedocromil

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(ne doe KROE mil)

U.S. Brand NamesAlocril®; Tilade® [DSC]

Canadian Brand NamesAlocril®; Tilade®

Pharmacologic CategoryMast Cell Stabilizer

Use: Labeled Indications

Aerosol: Maintenance therapy in patients with mild to moderate bronchial asthma

Ophthalmic: Treatment of itching associated with allergic conjunctivitis

Dosing: Adults

Asthma: Inhalation: 2 inhalations 4 times/day; may reduce dosage to 2-3 times/day once desired clinical response to initial dose is observed. Drug has no known therapeutic systemic activity when delivered by inhalation.

Allergic conjunctivitis: Ophthalmic: 1-2 drops in each eye twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Asthma: Inhalation: Children ≥6 years: Refer to adult dosing.

Allergic conjunctivitis: Ophthalmic: Children ≥3 years: Refer to adult dosing.

Administration: OtherOphthalmic: Do not allow tip of container to touch eye, surrounding structures, fingers, or other surfaces to avoid bacterial contamination.

Storage

Alocril®: Store at 2°C to 25°C (36°F to 77°F).

Tilade®: Store at 2°C to 30°C (36°F to 86°F); do not freeze.

ContraindicationsHypersensitivity to nedocromil or any component of the formulation

Warnings/Precautions

Dosage form specific issues:

- Aerosol: Safety and efficacy have not been established in children <6 years of age; if systemic or inhaled steroid therapy is at all reduced, monitor patients carefully; nedocromil is **not** a bronchodilator and, therefore, should not be used for reversal of acute bronchospasm

- Ophthalmic solution: Contains benzalkonium chloride, which may be absorbed by contact lenses; users of contact lenses should not wear them during periods of symptomatic allergic conjunctivitis; safety and efficacy have not been established in children <3 years of age.

Geriatric ConsiderationsElderly may have difficulty using inhaler delivery system, especially if they have physical or medical impairment (eg, Parkinson's disease, stroke). If this prophylactic modality is desired but patient cannot tolerate nedocromil inhalations, consider cromolyn sodium solution for nebulizer use.

Pregnancy Risk FactorB

Pregnancy ConsiderationsThere are no well-controlled studies in pregnant women. Animal studies show no evidence of teratogenicity or harm to fetus. Additionally, nedocromil has minimal systemic absorption.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Inhalation aerosol:

>10%: Gastrointestinal: Unpleasant taste (12%)

1% to 10%:

Central nervous system: Headache (8%), fatigue (1 %)

Gastrointestinal: Nausea (4%), vomiting (3%), dyspepsia (2%), diarrhea (1%), abdominal pain (2%)

Ocular: Conjunctivitis (1%)

Respiratory: Cough (9%), pharyngitis (8%), rhinitis (7%), upper respiratory infection

Ophthalmic solution:

>10%:

Central nervous system: Headache (40%)

Gastrointestinal: Unpleasant taste

Ocular: Burning, irritation, stinging

Respiratory: Nasal congestion

1% to 10%:

Ocular: Conjunctivitis, eye redness, photophobia

Respiratory: Asthma, rhinitis

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringNot for use during acute bronchospasm. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationAerosol: Do not use during acute bronchospasm. Use exactly as directed; do not use more often than instructed or discontinue without consulting prescriber. You may experience drowsiness, dizziness, fatigue, especially during early therapy (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report persistent runny nose, cough, cold symptoms; unresolved GI effects; skin rash; joint pain or tremor; or if breathing difficulty persists or worsens. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Inhaler: Review use with prescriber or follow package insert for directions. Prime with 3 activations prior to first use or if unused more than 7 days. Keep inhaler clean and unobstructed. Always rinse mouth and throat after use of inhaler to prevent advantageous infection. If you are also using a steroid bronchodilator, wait 10 minutes before using this aerosol.

Ophthalmic: Do not wear contact lenses with allergic conjunctivitis. For the eye only. Open eyes, look up, and pull lower lid down. Squeeze medicine into lower eyelid and close eye. Do not touch bottle tip to eye, eyelid, or other skin.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol for oral inhalation, as sodium:

Tilade®: 1.75 mg/activation (16.2 g; at least 104 inhalations) [DSC]

Solution, ophthalmic, as sodium:

Alocril®: 2% (5 mL) [contains benzalkonium chloride]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Alocril)

2% (5): $85.99

Mechanism of ActionInhibits the activation of and mediator release from a variety of inflammatory cell types associated with asthma including eosinophils, neutrophils, macrophages, mast cells, monocytes, and platelets; it inhibits the release of histamine, leukotrienes, and slow-reacting substance of anaphylaxis; it inhibits the development of early and late bronchoconstriction responses to inhaled antigen

Pharmacodynamics/Kinetics

Onset of action: Inhalation: Full therapeutic effect may not occur until ≥1 week of therapy

Duration: Therapeutic effect: Inhalation: 2 hours

Absorption: Inhalation: Low; Ophthalmic: Low

Protein binding, plasma: 89%

Bioavailability: Inhalation: 2% to 17%; Ophthalmic: <4%

Half-life elimination: 1.5-3.3 hours

Excretion: Urine 70% (as unchanged drug); feces 30% (as unchanged drug)

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

Serzone® may be confused with selegiline, Serentil®, Seroquel®, sertraline

Pronunciation(nef AY zoe done)

Pharmacologic CategoryAntidepressant, Serotonin Reuptake Inhibitor/Antagonist

Use: Labeled IndicationsTreatment of depression

Use: Unlabeled/InvestigationalPost-traumatic stress disorder

Dosing: Adults**Depression:** Oral: 200 mg/day, administered in two divided doses initially, with a range of 300-600 mg/day in two divided doses thereafter.

Dosing: ElderlyOral: Initial: 50 mg twice daily; increase dose to 100 mg twice daily in 2 weeks; usual maintenance dose: 200-400 mg/day

Dosing: Pediatric**Depression (unlabeled use):** Oral: Children and Adolescents: Target dose: 300-400 mg/day (mean: 3.4 mg/kg)

Administration: OralDosing after meals may decrease lightheadedness and postural hypotension, but may also decrease absorption and therefore effectiveness.

StorageStore at room temperature, below 40°C (104°F) in a tight container.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to nefazodone, related compounds (phenylpiperazines), or any component of the formulation; liver injury due to previous nefazodone treatment, active liver disease, or elevated serum transaminases; concurrent use or use of MAO inhibitors within previous 14 days; use in a patient during the acute recovery phase of MI; concurrent use with carbamazepine, cisapride, or pimozide; concurrent therapy with triazolam or alprazolam is generally contraindicated (dosage must be reduced by 75% for triazolam and 50% for alprazolam; such reductions may not be possible with available dosage forms).

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Nefazodone is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Nefazodone is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is very low relative to other antidepressants.

- Hepatic failure: Cases of life-threatening hepatic failure have been reported (risk should be considered when choosing an agent for the treatment of depression); discontinue if clinical signs or symptoms suggest liver failure.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is low relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is low relative to other antidepressants.

- Sexual dysfunction: Rare reports of priapism have occurred. The incidence of sexual dysfunction with nefazodone is generally lower than with SSRIs.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is very low relative to other antidepressants.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs; does not potentiate ethanol but use is not advised.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsData on nefazodone in the elderly are limited, specifically regarding efficacy; clinical trials in adult patients have found it superior to placebo and similar to imipramine; nefazodone's C_{max} and AUC have been reported to be increased twofold in the elderly and women after a single dose compared to younger patients, however, these differences were markedly reduced with multiple dosing with women having AUC values of nefazodone and its hydroxy metabolite remaining approximately 50% higher

Pregnancy Risk FactorC

Pregnancy ConsiderationsNefazodone is classified as pregnancy category C due to adverse effects observed in animal studies. When nefazodone is taken during pregnancy, an increased risk of major malformations has not been observed in the small number of pregnancies studied. The long-term effects on neurobehavior have not been evaluated.

Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. Therapy during pregnancy should be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician. If treatment during pregnancy is required, consider tapering therapy during the third trimester to prevent potential withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk of relapse from her major depressive disorder, the medication can be restarted following delivery.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsNefazodone and its metabolites are excreted in breast milk. Drowsiness, lethargy, poor feeding, and failure to maintain body temperature have been reported in a premature nursing infant. Adverse events were not observed in two case reports of older infants. The long-term effects on neurobehavior have not been studied. The manufacturer recommends that caution be exercised when administering nefazodone to nursing women.

Pregnancy & Lactation, In-Depth

- Nefazodone in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Headache, drowsiness, insomnia, agitation, dizziness

Gastrointestinal: Xerostomia, nausea, constipation

Neuromuscular & skeletal: Weakness

1% to 10%:

Cardiovascular: Bradycardia, hypotension, peripheral edema, postural hypotension, vasodilation

Central nervous system: Chills, fever, incoordination, lightheadedness, confusion, memory impairment, abnormal dreams, decreased concentration, ataxia, psychomotor retardation, tremor

Dermatologic: Pruritus, rash

Endocrine & metabolic: Breast pain, impotence, libido decreased

Gastrointestinal: Gastroenteritis, vomiting, dyspepsia, diarrhea, increased appetite, thirst, taste perversion

Genitourinary: Urinary frequency, urinary retention

Hematologic: Hematocrit decreased

Neuromuscular & skeletal: Arthralgia, hypertonia, paresthesia, neck rigidity, tremor

Ocular: Blurred vision (9%), abnormal vision (7%), eye pain, visual field defect

Otic: Tinnitus

Respiratory: Bronchitis, cough, dyspnea, pharyngitis

Miscellaneous: Flu syndrome, infection

<1%: Abdomen enlarged, abnormal gait, accommodation abnormality, acne, allergic reaction, alopecia, ALT increased, amenorrhea, anemia, angina pectoris, anorgasmia, apathy, arthritis, AST increased, asthma, attention decreased, AV block, breast enlargement, bruising, bursitis, cellulitis, cerebrovascular accident, colitis, CHF, conjunctivitis, cystitis, deafness, depersonalization, derealization, diplopia, dry eyes, dry skin, dehydration, dysarthria, ear pain, eczema, ejaculation abnormal, epistaxis, eructation, esophagitis, euphoria, face edema, gastritis, gingivitis, glaucoma, gout, halitosis, hallucinations, hangover effect, hematuria, hemorrhage, hernia, hiccup, hostility, hyperacusis, hypercholesteremia, hyperesthesia, hyperkinesia, hypertension, hyperventilation, hypoglycemia, hypotonia, keratoconjunctivitis, kidney calculus, lactic dehydrogenase increased, laryngitis, leukopenia, libido increased, liver function tests abnormal, lymphadenopathy, maculopapular rash, malaise, menorrhagia, metrorrhagia, mouth ulceration, muscle stiffness, myoclonus, mydriasis, neuralgia, neuroleptic malignant syndrome, night blindness, nocturia, oliguria, oral moniliasis, pallor, paranoid reaction, pelvic pain, periodontal abscess, peptic ulcer, photophobia, photosensitivity, pneumonia, polyuria, ptosis, rectal hemorrhage, salivation increased, stomatitis, suicide attempt, suicidal thoughts, suicide, syncope, tachycardia, taste loss, tendonitis, contracture, tenosynovitis, thinking abnormal, twitching, ulcerative colitis, urticaria, uterine fibroids enlarged, uterine hemorrhage, urinary incontinence, urinary urgency, ventricular extrasystoles, vaginal hemorrhage, varicose vein, vertigo, vesiculobullous rash, voice alteration, weight loss, yawn

Postmarketing and/or case reports: Angioedema, convulsions, galactorrhea, grand mal seizure, gynecomastia, hepatic failure, hepatic necrosis, hepatitis, hyponatremia, priapism, prolactin increased, rhabdomyolysis (with lovastatin/simvastatin), serotonin syndrome, Stevens-Johnson syndrome, thrombocytopenia

⇧ Metabolism/Transport Effects**Substrate** (major) of CYP2D6, 3A4; **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2D6 (weak), 3A4 (strong)
⇧ Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Nefazodone may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: May enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Cardiac Glycosides: Nefazodone may increase the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Nefazodone may decrease the metabolism of Cisapride. *Risk X: Avoid combination*

Clozapine: Nefazodone may decrease the metabolism of Clozapine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Nefazodone may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Nefazodone may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: May enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tacrolimus: Antidepressants (Serotonin Reuptake Inhibitor/Antagonist) may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Nefazodone absorption may be delayed and bioavailability may be decreased if taken with food.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersIf AST/ALT increase >3 times ULN, the drug should be discontinued and not reintroduced; mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks

Reference RangeTherapeutic plasma levels have not yet been defined

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for clinical worsening and suicidal ideation. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsIf AST/ALT increase >3 times ULN, the drug should be discontinued and not reintroduced.

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or orthostatic hypotension (use caution when climbing stairs or changing position from lying or sitting to standing). Report persistent insomnia or excessive daytime sedation; suicidal ideation; muscle cramping, tremors, weakness, tiredness, or change in gait; chest pain, palpitations, or rapid heartbeat; vision changes or eye pain; respiratory difficulty or breathlessness; malaise, loss of appetite, GI complaints, abdominal pain, or blood in stool; yellowing of skin or eyes (jaundice); or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 50 mg, 100 mg, 150 mg, 200 mg, 250 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Nefazodone HCl)

50 mg (60): $34.00

100 mg (60): $43.00

150 mg (30): $22.99

200 mg (60): $45.99

250 mg (60): $44.99

Mechanism of Action Inhibits neuronal reuptake of serotonin and norepinephrine; also blocks 5-HT$_2$ and alpha$_1$ receptors; has no significant affinity for alpha$_2$, beta-adrenergic, 5-HT$_{1A}$, cholinergic, dopaminergic, or benzodiazepine receptors

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: Up to 6 weeks

Distribution: V$_d$: 0.22-0.87 L/kg

Protein binding: >99%

Metabolism: Hepatic to three active metabolites: Triazoledione, hydroxynefazodone, and m-chlorophenylpiperazine (mCPP)

Bioavailability: 20% (variable)

Half-life elimination: Parent drug: 2-4 hours; active metabolites persist longer

Time to peak, serum: 1 hour, prolonged in presence of food

Excretion: Primarily urine (as metabolites); feces

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile

Pharmacotherapy Pearls May cause less sexual dysfunction than other antidepressants. Women and elderly receiving single doses attain significant higher peak concentrations than male volunteers.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Nefazodone inhibits reuptake of both serotonin and norepinephrine and also blocks some serotonin receptors. No precautions with vasoconstrictors appear to be necessary.

Mental Health: Child/Adolescent Considerations Seven treatment-refractory and very comorbid children and adolescents (mean age: 12.4 years) with a juvenile mood disorder were treated with a mean daily dose of 357 mg (3.4 mg/kg) for 13 weeks (Wilens, 1997).

Wilens TE, Spencer TJ, Biederman J, et al, “Case Study: Nefazodone for Juvenile Mood Disorders,” *J Am Acad Child Adolesc Psychiatry*, 1997, 36(4):481-5.

Mental Health Comment Due to its 5-HT$_2$ antagonistic activity, nefazodone is associated with a low incidence of sexual dysfunction. Nefazodone may be useful for individuals with post-traumatic stress disorder. Nefazodone has a lower incidence of sedation and orthostasis than trazodone, primarily related to its noradrenergic activity.

Index Terms Nefazodone Hydrochloride; Serzone

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(nel AY re been)

U.S. Brand NamesArranon®

Canadian Brand NamesAtriance™

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite

Use: Labeled IndicationsTreatment of relapsed or refractory T-cell acute lymphoblastic leukemia (ALL) and T-cell lymphoblastic lymphoma

Use: Unlabeled/InvestigationalCML (Philadelphia chromosome positive) T-Cell blast phase

Dosing: Adults**T-cell ALL, T-cell lymphoblastic lymphoma:** I.V.: 1500 mg/m^2/day on days 1, 3, and 5; repeat every 21 days.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**T-cell ALL, T-cell lymphoblastic lymphoma:** I.V.: 650 mg/m^2/day on days 1 through 5; repeat every 21 days.

Dosing: Renal Impairment

Cl_{cr} ≥50 mL/minute: No adjustment recommended.

Cl_{cr} <50 mL/minute: Safety has not been established.

Cl_{cr} <30 mL/minute: Closely monitor.

Dosing: Hepatic ImpairmentSafety has not been established; closely monitor with severe impairment (bilirubin >3 mg/dL).

Dosing: Adjustment for Toxicity

Neurologic toxicity ≥ grade 2: Discontinue treatment.

Hematologic or other (non-neurologic) toxicity: Consider treatment delay.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Adequate I.V. hydration recommended to prevent tumor lysis syndrome; allopurinol may be used if hyperuricemia is anticipated.

Children: Infuse over 1 hour daily for 5 consecutive days

Adults: Infuse over 2 hours on days 1, 3, and 5

Administration: I.V. DetailpH: 5-7

StorageStore unopened vials at 15°C to 30°C (59°F to 86°F). Stable in plastic or glass containers for up to 8 hours at room temperature.

ReconstitutionReconstitution is not required; the appropriate dose should be added to empty plastic bag or glass container.

CompatibilityStable in sodium chloride 0.45%.

ContraindicationsHypersensitivity to nelarabine or any component of the formulation

Warnings/Precautions

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Leukopenia, thrombocytopenia, anemia, and neutropenia commonly occur.

- Neurotoxicity: **[U.S. Boxed Warning]: Neurotoxicity is the dose-limiting toxicity;** observe closely for signs and symptoms of neurotoxicity (somnolence, confusion, convulsions, ataxia, paresthesia, hypoesthesia, coma, status epilepticus, craniospinal demyelination, or ascending neuropathy). Risk of neurotoxicity may increase in patients with concurrent or previous intrathecal chemotherapy or history of craniospinal irradiation.

- Tumor lysis syndrome: Appropriate measures must be taken to prevent hyperuricemia and tumor lysis syndrome; use extreme caution in patients with increased uric acid, gout, and history of uric acid stones; monitor, consider allopurinol and hydrate accordingly.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; monitor closely. Risk of adverse reactions may be higher with hepatic dysfunction.

- Renal impairment: Use with caution in patients with renal impairment; monitor closely. Ara-G clearance may be reduced with renal dysfunction

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

- Vaccines: Avoid administration of live vaccines.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to use effective contraception and avoid becoming pregnant during therapy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions**Note:** Pediatric adverse reactions fell within a range similar to adults except where noted.

>10%:

Cardiovascular: Peripheral edema (15%), edema (11%)

Central nervous system: Fatigue (50%), fever (23%), somnolence (7% to 23%; grades 2-4: 1% to 6%), dizziness (21%; grade 2: 8% adults), headache (15% to 17%; grades 2-4: 4% to 8%), hypoesthesia (6% to 17%; grades 2-4: children 5%, adults 12%), pain (11%)

Dermatologic: Petechiae (12%)

Endocrine & metabolic: Hypokalemia (11%)

Gastrointestinal: Nausea (41%), diarrhea (22%), vomiting (10% to 22%), constipation (21%)

Hematologic: Anemia (95% to 99%; grade 4: 10% to 14%), neutropenia (81% to 94%; grade 4: children 62%, adults 49%), thrombocytopenia (86% to 88%; grade 4: 22% to 32%), leukopenia (38%; grade 4: 7%), febrile neutropenia (12%; grade 4: 1%)

Hepatic: Transaminases increased (12%)

Neuromuscular & skeletal: Peripheral neuropathy (12% to 21%; grades 2-4: 11% to 14%), weakness (6% to 17%; grade 4: 1%), paresthesia (4% to 15%; grades 2-4: 3% to 4%), myalgia (13%)

Respiratory: Cough (25%), dyspnea (7% to 20%)

1% to 10%:

Cardiovascular: Hypotension (8%), tachycardia (8%), chest pain (5%)

Central nervous system: Ataxia (2% to 9%; grades 2-4: children 1%, adults 8%), confusion (8%), insomnia (7%), depressed level of consciousness (6%; grades 2-4: 2%), depression (6%), seizure (grade 3: 1% adults; grade 4: 6% children), motor dysfunction (4%; grades 2-4: 2%), amnesia (3%; grades 2-4: 1%), balance disorder (2%; grades 2-4: 1%), nerve paralysis (2%), sensory loss (1% to 2%), aphasia (1%), cerebral hemorrhage (1%), coma (1%), encephalopathy (1%), hemiparesis (1%), hydrocephalus (1%), lethargy (1%), leukoencephalopathy (1%), loss of consciousness (1%), mental impairment (1%), neuropathic pain (1%), nerve palsy (1%), nystagmus (1%), paralysis (1%), sciatica (1%), sensory disturbance (1%), speech disorder (1%), demyelination, ascending peripheral neuropathy

Endocrine & Metabolic: Hypocalcemia (8%), dehydration (7%), hyper-/hypoglycemia (6%), hypomagnesemia (6%)

Gastrointestinal: Abdominal pain (9%), anorexia (9%), stomatitis (8%), abdominal distension (6%), taste perversion (3%)

Hepatic: Albumin decreased (10%), bilirubin increased (10%), AST increased (6%)

Neuromuscular & skeletal: Arthralgia (9%), back pain (8%), muscle weakness (8%), rigors (8%), limb pain (7%), abnormal gait (6%), noncardiac chest pain (5%), tremor (4% to 5%; grades 2-4: 2% to 3%), dysarthria (1%), hyporeflexia (1%), hypertonia (1%), incoordination (1%)

Ocular: Blurred vision (4%)

Renal: Creatinine increased (6%)

Respiratory: Pleural effusion (10%), epistaxis (8%), pneumonia (8%), sinusitis (7%), wheezing (5%), sinus headache (1%)

Miscellaneous: Infection (5% to 9%)

Postmarketing and/or case reports: Tumor lysis syndrome

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersClosely monitor for neurologic toxicity (severe somnolence, seizure, peripheral neuropathy, confusion, ataxia, paresthesia, hypoesthesia, coma, or craniospinal demyelination); signs and symptoms of tumor lysis syndrome; hydration status; CBC with platelet counts, liver and kidney function

Nursing: Physical Assessment/MonitoringShould be administered only under the supervision of a physician experienced in the use of antineoplastic therapy. Assess results of laboratory tests (eg, CBC, renal and hepatic function), therapeutic response, and adverse reactions (eg, neurotoxicity [somnolence, confusion, convulsions, hypoesthesia, paresthesia, peripheral neuropathy], gastrointestinal [diarrhea, nausea, vomiting, pain, dehydration], hematologic [anemia, neutropenia, thrombocytopenia], cardiovascular [edema]), at beginning and regularly throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with platelet counts, liver and kidney function

Patient EducationThis medication can only be administered via intravenous infusion. You will be monitored closely during treatment. Report any burning, pain, redness, or swelling at infusion site. You may experience dizziness or sleepiness (use caution when driving, climbing stairs, making sudden movements, or engaging in hazardous tasks). Report immediately any sign of nervous system reactions (eg, excessive sleepiness, seizures, numbness or tingling in hands, fingers, feet, or toes; problems with fine motor skills [eg, buttoning clothes]; unsteadiness, tripping while walking, increased weakness when getting out of a chair, bed, or walking up stairs); unresponsiveness or coma; persistent vomiting or diarrhea; blurred vision; difficulty breathing; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution:

Arranon®: 5 mg/mL (50 mL)

Atriance™ [CAN]: 5 mg/ml (50 mL)

Generic AvailableNo

ManufacturerGlaxoSmithKline

Mechanism of ActionNelarabine, a prodrug of ara-G, is demethylated by adenosine deaminase to ara-G and then converted to ara-GTP. Ara-GTP is incorporated into the DNA of the leukemic blasts, leading to inhibition of DNA synthesis and inducing apoptosis. Ara-GTP appears to accumulate at higher levels in T-cells, which correlates to clinical response.

Pharmacodynamics/Kinetics

Distribution: V_{ss}:

Nelarabine: Children: ~213 L/m^2; Adults: ~197 L/m^2

Ara-G: Children: ~50 L/m^2; Adults: ~33 L/m^2

Protein binding: Nelarabine and ara-G: <25%

Metabolism: Hepatic; demethylated by adenosine deaminase to form ara-G (active); also hydrolyzed to form methylguanine. Both ara-G and methylguanine metabolized to guanine. Guanine is deaminated into xanthine, which is further oxidized to form uric acid, which is then oxidized to form allantoin.

Half-life elimination: Nelarabine: 30 minutes; ara-G: 3 hours

Time to peak: Ara-G: 3-25 hours

Excretion: Urine (nelarabine 7%, ara-G 27%) within 24 hours of infusion on day 1

Nelfinavir: Health Canada Issues Update on Impurity Warning - August 2008

Health Canada has notified Canadian healthcare professionals that they have reached agreement with Pfizer Canada, on acceptable limits of the impurity, ethyl methanesulfonate (EMS), created during the manufacturing process of nelfinavir (Viracept®). A similar agreement previously was reached between Pfizer and the U.S. Food and Drug Administration (FDA). Health Canada is reassuring Canadians that the nelfinavir product presently on the Canadian market contains acceptable levels of EMS and that warnings against its use in **HIV-infected nonpregnant adults and children** no longer apply. In contrast to the U.S. FDA recommendations, Health Canada **does not recommend** the use of nelfinavir during pregnancy due to concerns related to EMS exposure.

Further information may be obtained at:

http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_144-eng.php

Medication Safety Issues

Sound-alike/look-alike issues:

Nelfinavir may be confused with nevirapine

Viracept® may be confused with Viramune®

Pronunciation(nel FIN a veer)

U.S. Brand NamesViracept®

Canadian Brand NamesViracept®

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsIn combination with other antiretroviral therapy in the treatment of HIV infection

Dosing: Adults**HIV infection:** Oral: 750 mg 3 times/day or 1250 mg twice daily with meals in combination with other antiretroviral therapies

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**HIV infection:** Oral: Children 2-13 years: 45-55 mg/kg twice daily **or** 25-35 mg/kg 3 times/day (maximum: 2500 mg/day). If tablets are unable to be taken, use oral powder in small amount of water, milk, formula, or dietary supplements; do not use acidic food/juice or store for >6 hours.

Dosing: Renal ImpairmentNo pharmacokinetic data in patients with renal impairment. However, <2% of dose excreted in urine; no dose adjustment is needed.

Dosing: Hepatic ImpairmentNo dose adjustment necessary in mild impairment (Child-Pugh class A); not recommended in patients with moderate-to-severe impairment (Child-Pugh class B or C)

Administration: Oral

Oral powder: Administer with a meal. Mix powder in a small amount of water, milk, formula, soy milk, soy formula, pudding, ice cream, or dietary supplement. Do not reconstitute the oral powder in its original container. Be sure entire contents is consumed to receive full dose. Do not use acidic food/juice to dilute due to bitter taste. Once mixed, solution should be used immediately, but may be stored for up to 6 hours if refrigerated.

Tablets: Administer with a meal. If unable to swallow tablets, may dissolve tablets in a small amount of water; mix cloudy liquid well and consume immediately. Rinse glass with water to ensure receiving full dose. Tablets may also be crushed and mixed with pudding.

Dietary ConsiderationsShould be taken as scheduled with a meal. Oral powder contains phenylalanine 11.2 mg/g.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Oral powder (or dissolved tablets) diluted in nonacidic liquid is stable for 6 hours under refrigeration.

ContraindicationsHypersensitivity to nelfinavir or any component of the formulation; concurrent therapy with amiodarone, ergot derivatives, midazolam, pimozide, quinidine, triazolam

Allergy Considerations

- Nelfinavir Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory

response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.

- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.

- Hepatic impairment: May cause hepatitis and/or exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis; use not recommended with moderate-to-severe impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Not recommended for use with rifampin, St John’s wort, lovastatin, simvastatin, phosphodiesterase-5 (PDE-5) inhibitors, or proton pump inhibitors (based on omeprazole data)

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Dosage form specific issues:

- Oral powder: Formulation contains phenylalanine.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal studies and no increased risk of overall birth defects has been observed following 1st trimester exposure in humans according to data collected by the antiretroviral pregnancy registry. Nelfinavir crosses the placenta. The Perinatal HIV Guidelines Working Group recommends nelfinavir as an alternative PI in combination regimens during pregnancy with HAART for perinatal prophylaxis. A dose of 1250 mg twice daily has been shown to provide adequate plasma concentrations although lower and variable levels may occur late in pregnancy. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsNelfinavir is minimally excreted in breast milk. HIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsData presented on experience in adults, unless otherwise noted.

>10%: Gastrointestinal: Diarrhea (14% to 20%; children: 39% to 47%)

2% to 10%:

Dermatologic: Rash (1% to 3%)

Gastrointestinal: Nausea (3% to 7%), flatulence (1% to 5%)

Hematologic: Lymphocytes decreased (1% to 6%), neutrophils decreased (1% to 5%)

<2% (Limited to important or life-threatening): Abdominal pain, acute iritis, alkaline phosphatase increased, allergic reaction, amylase increased, anemia, anorexia, anxiety, arthralgia, arthritis, back pain, body fat redistribution/accumulation, cramps, creatinine phosphokinase increased, dehydration, depression, dermatitis, diaphoresis, dizziness, dyspepsia, dyspnea, emotional lability, epigastric pain, eye disorder, fever, folliculitis, fungal dermatitis, gastrointestinal bleeding, GGTP increased, headache, hepatitis, hyperkinesia, hyper-/hypoglycemia, hyperlipemia, hyperuricemia, insomnia, kidney calculus, lactic dehydrogenase increased, leukopenia, lipoatrophy, lipodystrophy, liver function tests abnormal, maculopapular rash, malaise, migraine, mouth ulceration, myalgia, myasthenia, myopathy, pain, pancreatitis, paresthesia, pharyngitis, pruritus, rhinitis, seizure, sexual dysfunction, sinusitis, sleep disorder, somnolence, suicidal ideation, transaminases increased, thrombocytopenia, urine abnormality, urticaria, vomiting, weakness

Postmarketing and/or case reports: Bilirubinemia; hypersensitivity reaction (bronchospasm, rash, edema); immune reconstitution syndrome, jaundice, metabolic acidosis, QT_c prolongation, torsade de pointes

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor), 2C19 (major), 2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (strong)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Azithromycin: Nelfinavir may decrease the excretion of Azithromycin. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Efavirenz: May increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: Protease Inhibitors may decrease the serum concentration of Etravirine. This effect is anticipated with darunavir & saquinavir (with low-dose ritonavir). Etravirine may increase the serum concentration of Protease Inhibitors. This effect is anticipated with nelfinavir. Protease Inhibitors may increase the serum concentration of Etravirine. This is expected with lopinavir/ritonavir. Management: Low-dose ritonavir boosting MUST be used when these protease inhibitors are used with etravirine. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

H2-Antagonists: May decrease the serum concentration of Nelfinavir. Concentrations of the active M8 metabolite may also be reduced. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Nelfinavir taken with food increases plasma concentration time curve (AUC) by two- to threefold. Do not administer with acidic food or juice (orange juice, apple juice, or applesauce) since the combination may have a bitter taste.

Herb/Nutraceutical: St John's wort may decrease the levels/effects of protease inhibitors; concurrent use should probably be avoided.

Monitoring ParametersLiver function tests, viral load, CD4 count, triglycerides, cholesterol, blood glucose, CBC with differential

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (multiple liver enzyme interactions may increase or decrease levels/effects of drugs and increase potential for severe toxicity or loss of effectiveness); dosing adjustments may be necessary. A list of medications that should not be used concurrently is available in each bottle and patients should be provided with this information. Assess therapeutic response (CD4 count, hepatic function, CBC, serum glucose) and adverse reactions at regular intervals during therapy. Caution patients to monitor glucose levels closely; may cause hyperglycemia or new-onset diabetes. Teach patient proper use (eg, timing of multiple medications), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLiver function tests, blood glucose levels, CBC with differential, CD4 cell count, plasma levels of HIV RNA

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescription or OTC medications or herbal products during therapy - even if they are not on the list - without consulting prescriber. This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other people. Take as directed with food. Mix powder with nonacid, noncitric water or dairy products - milk, pudding, or ice cream. If unable to swallow tablets whole, the tablet may be dissolved in a small amount of water and consumed immediately; rinse glass with water to ensure receiving full dose. Maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake). You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). This medication will be prescribed with a combination of other medications; time these medications as directed by prescriber. You may be advised to check your glucose levels; this drug can cause hyperglycemia. Frequent blood tests may be required with prolonged therapy. May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug); diarrhea (buttermilk, boiled milk, or yogurt may help - if persistent, contact prescriber for appropriate antidiarrheal); or nausea (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Inform prescriber if you experience unusual or persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder, oral:

Viracept®: 50 mg/g (144 g) [contains phenylalanine 11.2 mg/g]

Tablet:

Viracept®: 250 mg, 625 mg

Generic AvailableNo

ManufacturerAgouron Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Powder (Viracept)

50 mg/g (144): $63.62

Tablets (Viracept)

250 mg (300): $670.98

Mechanism of ActionInhibits the HIV-1 protease; inhibition of the viral protease prevents cleavage of the gag-pol polyprotein resulting in the production of immature, noninfectious virus

Pharmacodynamics/Kinetics

Absorption: Food increases AUC of nelfinavir by two- to fivefold

Distribution: V_d: 2-7 L/kg

Protein binding: >98%

Metabolism: Hepatic via CYP2C19 and 3A4; major metabolite has activity comparable to parent drug

Half-life elimination: 3.5-5 hours

Time to peak, serum: 2-4 hours

Excretion: Feces (98% to 99%, 78% as metabolites, 22% as unchanged drug); urine (1% to 2%)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Pharmacotherapy PearlsA patient package insert (PPI), including a list of medications that should not be taken with nelfinavir, is available and should be dispensed with medication.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth ulcers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, anxiety, insomnia, difficulty concentrating, depression, and suicidal ideation

Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with midazolam and triazolam may produce oversedation; barbiturates and carbamazepine may decrease the effectiveness of nelfinavir. Concomitant use of nelfinavir and St John's wort is not recommended. Coadministration of protease inhibitors (nelfinavir) with St John's wort is expected to substantially decrease protease inhibitor serum concentrations leading to a loss of virologic response and possible resistance to nelfinavir or to the class of protease inhibitors. Concomitant use with trazodone may increase plasma levels of trazodone; monitor for nausea, dizziness, hypotension, and syncope; consider using a lower dose of trazodone.

Pronunciation(nee oh MYE sin & pol i MIKS in bee)

U.S. Brand NamesNeosporin速 G.U. Irrigant

Canadian Brand NamesNeosporin速 Irrigating Solution

Pharmacologic CategoryAntibiotic, Topical; Genitourinary Irrigant

Use: Labeled IndicationsShort-term as a continuous irrigant or rinse in the urinary bladder to prevent bacteriuria and gram-negative rod septicemia associated with the use of indwelling catheters; to help prevent infection in minor cuts, scrapes, and burns

Dosing: AdultsBladder irrigation: **Not for I.V. injection**; add 1 mL irrigant to 1 L isotonic saline solution and connect container to the inflow of lumen of 3-way catheter. Continuous irrigant or rinse in the urinary bladder for up to a maximum of 10 days with administration rate adjusted to patient's urine output; usually no more than 1 L of irrigant is used per day.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: OtherBladder irrigant: Do not inject irrigant solution; concentrated irrigant solution must be diluted in 1 L normal saline before administration; connect irrigation container to the inflow lumen of a 3-way catheter to permit continuous irrigation of the urinary bladder

StorageStore irrigation solution in refrigerator. Aseptic prepared dilutions (1 mL/1 L) should be stored in the refrigerator and discarded after 48 hours.

ContraindicationsHypersensitivity to neomycin, polymyxin B, or any component of the formulation; pregnancy (GU irrigant)

Pregnancy Risk FactorC/D (for G.U. irrigant)

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Dermatologic: Contact dermatitis, erythema, rash, urticaria

Genitourinary: Bladder irritation

Local: Burning

Neuromuscular & skeletal: Neuromuscular blockade

Otic: Ototoxicity

Renal: Nephrotoxicity

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Pronunciation(nee oh MYE sin, koe LIS tin, hye droe KOR ti sone, & thon ZOE nee um)

U.S. Brand NamesColy-Mycin® S; Cortisporin®-TC

Pharmacologic CategoryAntibiotic/Corticosteroid, Otic

Use: Labeled IndicationsTreatment of superficial and susceptible bacterial infections of the external auditory canal; for treatment of susceptible bacterial infections of mastoidectomy and fenestration cavities

Dosing: Adults**Ear inflammation/infection:** Otic:

Calibrated dropper: 5 drops in affected ear 3-4 times/day

Dropper bottle: 4 drops in affected ear 3-4 times/day

Note: Alternatively, a cotton wick may be inserted in the ear canal and saturated with suspension every 4 hours; wick should be replaced at least every 24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Ear inflammation/infection:** Otic:

Calibrated dropper: 4 drops in affected ear 3-4 times/day

Dropper bottle: 3 drops in affected ear 3-4 times/day

Note: Alternatively, a cotton wick may be inserted in the ear canal and saturated with suspension every 4 hours; wick should be replaced at least every 24 hours

ContraindicationsHypersensitivity to any component of the formulation and/or aminoglycosides; herpes simplex, vaccinia, varicella

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if irritation occurs.

- Neomycin sensitization: May cause cutaneous sensitization, including itching, reddening, edema, and failure to heal. Neomycin may also cause sensorineural hearing loss (due to cochlear damage); risk is greater with prolonged use.

- Ototoxicity: Risk of ototoxicity is increased in patients with longstanding otitis media or tympanic perforation; use with caution.

Other warnings/precautions:

- Appropriate use: For otic use only; avoid contact with eyes. Avoid contaminating dropper.

- Duration of therapy: Do not use for longer than 10 days; prolonged treatment may result in overgrowth of nonsusceptible organisms.

Geriatric ConsiderationsMany elderly will overuse eye drops or use for nonindicated reasons; limit use.

Adverse ReactionsFrequency not defined.

Dermatologic: Hypersensitivity reaction, irritation

Otic: Ototoxicity (rare)

Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents for Neomycin and Hydrocortisone.

Medication Safety Issues

Sound-alike/look-alike issues:

AK-Trol® may be confused with AKTob®

Pronunciation(nee oh MYE sin, pol i MIKS in bee, & deks a METH a sone)
U.S. Brand NamesAK-Trol® [DSC]; Maxitrol®; Poly-Dex™
Canadian Brand NamesDioptrol®; Maxitrol®
Pharmacologic CategoryAntibiotic/Corticosteroid, Ophthalmic
Use: Labeled IndicationsSteroid-responsive inflammatory ocular conditions in which a corticosteroid is indicated and where bacterial infection or a risk of bacterial infection exists
Dosing: Adults **Ocular inflammation/infection:** Ophthalmic:

Ointment: Place a small amount (~$^{1}/_{2}$”) in the affected eye 3-4 times/day or apply at bedtime as an adjunct with drops

Suspension: Instill 1-2 drops into affected eye(s) every 3-4 hours; in severe disease, drops may be used hourly and tapered to discontinuation

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: OtherContact lenses should not be worn during therapy.

Ointment: Do not touch tip of tube to eye. Instill ointment into pocket between eyeball and lower lid; patient should look downward before closing eye.

Suspension: Shake suspension before use. Tilt head back, instill suspension in conjunctival sac and close eye(s). Do not touch dropper to eye. Apply light finger pressure on lacrimal sac for 1 minute following instillation.

ContraindicationsHypersensitivity to neomycin, polymyxin B, dexamethasone, or any component of the formulation; viral, fungal, or tuberculosis diseases of the eye
Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.
- Ocular effects: Prolonged use of corticosteroids may result in glaucoma; damage to the optic nerve, defects in visual acuity and fields of vision, and posterior subcapsular cataract formation may occur.
- Sensitivity reactions: Sensitivity to neomycin may develop; discontinue if sensitivity reaction occurs.

Special populations:

- Cataract surgery patients: Use following cataract surgery may delay healing or increase the incidence of bleb formation.

Dosage form specific issues:

- Benzalkonium chloride: Suspension contains benzalkonium chloride which may be adsorbed by contact lenses; contact lenses should not be worn during treatment of ophthalmic infections.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only. A maximum of 8 g of ointment or 20 mL of suspension should be prescribed initially; patients should be evaluated prior to additional refills.

Geriatric ConsiderationsAssess patients ability to self-administer.
Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsIt is unknown if topical use results in sufficient absorption to produce detectable quantities in breast milk.
Adverse ReactionsFrequency not defined: Ocular: Allergic sensitivity, cutaneous sensitization, eye pain, development of glaucoma, cataract, increased intraocular pressure, optic nerve damage, wound healing delayed

Metabolism/Transport EffectsDexamethasone: **Substrate** of CYP3A4 (minor); **Induces** CYP2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Lenalidomide: Dexamethasone may enhance the thrombogenic effect of Lenalidomide. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Thalidomide: Dexamethasone may enhance the dermatologic adverse effect of Thalidomide. Dexamethasone may enhance the thrombogenic effect of Thalidomide. *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Monitoring ParametersMonitor intraocular pressure with use longer than 10 days

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Ointment, ophthalmic (Maxitrol®, Poly-Dex™): Neomycin 3.5 mg, polymyxin B sulfate 10,000 units, and dexamethasone 0.1% per g (3.5 g)

Suspension, ophthalmic (AK-Trol® [DSC], Maxitrol®, Poly-Dex™): Neomycin 3.5 mg, polymyxin B sulfate 10,000 units, and dexamethasone 0.1% per mL (5 mL) [contains benzalkonium chloride]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Ointment (Maxitrol)

0.1-5-10000 (3.5): $79.70

Ointment (Neomycin-Polymyxin-Dexameth)

5-10000-0.1 (3.5): $11.99

Suspension (Maxitrol)

5-10000-0.1 (5): $69.47

Suspension (Neomycin-Polymyxin-Dexameth)

5-10000-0.1 (5): $11.99

Mechanism of ActionSee individual agents.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsDexamethasone, Neomycin, and Polymyxin B; Polymyxin B, Neomycin, and Dexamethasone

Jump To Field (Select Field Name)

Pronunciation(nee oh MYE sin, pol i MIKS in bee, & gram i SYE din)
U.S. Brand NamesNeosporin® Ophthalmic Solution
Canadian Brand NamesNeosporin®; Optimyxin Plus®
Pharmacologic CategoryAntibiotic, Ophthalmic
Use: Labeled IndicationsTreatment of superficial ocular infection
Dosing: AdultsOphthalmic: Instill 1-2 drops 4-6 times/day or more frequently as required for severe infections
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
ContraindicationsHypersensitivity to neomycin, polymyxin B, gramicidin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Neomycin sensitization: Symptoms of neomycin sensitization include itching, reddening, edema, and failure to heal.
- Ocular effects (prolonged use): Glaucoma, defects in visual acuity, posterior subcapsular cataract formation, and secondary ocular infections may result from prolonged use.

Geriatric ConsiderationsAssess patient's ability to self-administer ophthalmic drops.
Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined: Ocular: Transient irritation, burning, stinging, itching, inflammation, angioneurotic edema, urticaria, vesicular and maculopapular dermatitis
Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: Neomycin 1.75 mg, polymyxin B 10,000 units, and gramicidin 0.025 mg per 1 mL (10 mL)

Neosporin® Ophthalmic Solution: Neomycin 1.75 mg, polymyxin B 10,000 units, and gramicidin 0.025 mg per 1 mL (10 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Neomycin-Polymyxin-Gramicidin)

2.5-10000-0.025 (10): $26.00

Solution (Neosporin)

0.025-2.5-10000 (10): $55.07

Mechanism of ActionInterferes with bacterial protein synthesis by binding to 30S ribosomal subunits; binds to phospholipids, alters permeability, and damages the bacterial cytoplasmic membrane permitting leakage of intracellular constituents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsGramicidin, Neomycin, and Polymyxin B; Polymyxin B, Neomycin, and Gramicidin

Jump To Field (Select Field Name)

Pronunciation(nee oh MYE sin, pol i MIKS in bee, & hye droe KOR ti sone)
U.S. Brand NamesCortisporin® Cream; Cortisporin® Ophthalmic [DSC]; Cortisporin® Otic; PediOtic®
Canadian Brand NamesCortimyxin®; Cortisporin® Otic
Pharmacologic CategoryAntibiotic, Ophthalmic; Antibiotic, Otic; Antibiotic, Topical; Corticosteroid, Ophthalmic; Corticosteroid, Otic; Corticosteroid, Topical
Use: Labeled IndicationsSteroid-responsive inflammatory condition for which a corticosteroid is indicated and where bacterial infection or a risk of bacterial infection exists
Dosing: Adults

Note: Duration of use of ophthalmic and otic preparations should be limited to 10 days unless otherwise directed by the healthcare provider.

Auditory canal inflammation/infection: Otic: Instill 4 drops 3-4 times/day; otic suspension is the preferred otic preparation. **Note:** Otic solution is used **only** for bacterial infections of external auditory canal (eg, swimmer's ear).

Ocular inflammation/infection: Ophthalmic: Instill 1-2 drops 2-4 times/day, or more frequently as required for severe infections

Dermatologic inflammation/infection: Topical: Apply a thin layer 1-4 times/day. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Note: Duration of use of ophthalmic and otic preparations should be limited to 10 days unless otherwise directed by the healthcare provider.

Auditory canal inflammation/infection: Otic:

Children 6 months to 2 years (unlabeled use): Instill 3 drops into affected ear 3-4 times/day

Children ≥2 years: Instill 3 drops into affected ear 3-4 times/day

Note: Otic solution is used **only** for bacterial infections of external auditory canal (eg, swimmer's ear).

Ocular inflammation/infection: Ophthalmic: Children (unlabeled use): Instill 1-2 drops 2-4 times/day, or more frequently as required for severe infections

Dermatologic inflammation/infection: Topical: Children (unlabeled use): Apply a thin layer 1-4 times/day. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Administration: OtherShake otic suspension well before using. Otic preparations should not be used when the integrity of the tympanic membrane is in question.
ContraindicationsHypersensitivity to neomycin, polymyxin B, hydrocortisone, or any component of the formulation; not for use in viral infections, fungal diseases, mycobacterial infections
Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Neomycin sensitization: Symptoms of neomycin sensitization include itching, reddening, edema, and failure to heal.

- Ototoxicity (otic preparations): Risk of ototoxicity is increased in patients with extended use or tympanic perforation; avoid use with tympanic perforation, limit therapy to 10 days.

- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, and fluid and electrolyte changes.

Dosage form specific issues:

- Sulfites: Some formulations may contain sulfites, which may cause allergic-type reactions in susceptible individuals.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined. For additional information, see individual agents.

Ophthalmic ointment:

Dermatologic: Delayed wound healing, rash

Ocular: Cataracts, corneal thinning, glaucoma, irritation, keratitis (bacterial), intraocular pressure increase, optic nerve damage, scleral thinning

Miscellaneous: Hypersensitivity (including anaphylaxis), secondary infection, sensitization to kanamycin, paromomycin, streptomycin, and gentamicin

Otic solution and suspension:

Dermatologic: Acneiform eruptions, allergic contact dermatitis, burning skin, dryness, folliculitis, hypertrichosis, hypopigmentation, irritation, maceration of skin, miliaria, ocular hypertension, perioral dermatitis, pruritus, skin atrophy, striae

Otic: Burning, ototoxicity, stinging

Renal: Nephrotoxicity

Miscellaneous: Hypersensitivity (including anaphylaxis), secondary infection, sensitization to karamycin, paromycin, streptomycin, and gentamicin

Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical (Cortisporin®): Neomycin 3.5 mg, polymyxin B 10,000 units, and hydrocortisone acetate 5 mg per g (7.5 g)

Solution, otic (Cortisporin®): Neomycin 3.5 mg, polymyxin B 10,000 units, and hydrocortisone 10 mg per mL (10 mL) [contains potassium metabisulfite]

Suspension, ophthalmic (Cortisporin® [DSC]): Neomycin 3.5 mg, polymyxin B 10,000 units, and hydrocortisone 10 mg per mL (7.5 mL) [contains thimerosal]

Pronunciation(nee oh MYE sin, pol i MIKS in bee, & pred NIS oh lone)

U.S. Brand NamesPoly-Pred速

Pharmacologic CategoryAntibiotic/Corticosteroid, Ophthalmic

Use: Labeled IndicationsSteroid-responsive inflammatory ocular condition in which bacterial infection or a risk of bacterial ocular infection exists

Dosing: Adults**Ocular inflammation/infection:** Ophthalmic: Instill 1-2 drops every 3-4 hours; acute infections may require every 30-minute instillation initially with frequency of administration reduced as the infection is brought under control. To treat the lids: Instill 1-2 drops every 3-4 hours, close the eye and rub the excess on the lids and lid margins.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

ContraindicationsHypersensitivity to neomycin, polymyxin B, prednisolone, or any component of the formulation

Allergy Considerations

- Corticosteroid Allergy

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Cutaneous sensitization, skin rash, delayed wound healing

Ocular: Increased intraocular pressure, glaucoma, optic nerve damage, cataracts, conjunctival sensitization, transient irritation, burning, stinging, itching, inflammation, angioneurotic edema, urticaria, vesicular and maculopapular dermatitis

Metabolism/Transport EffectsPrednisolone: **Substrate** of CYP3A4 (minor); **Inhibits** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, ophthalmic: Neomycin 0.35%, polymyxin B 10,000 units per mL, and prednisolone acetate 0.5% (5 mL; 10 mL [DSC]) [contains thimerosal]

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(nee oh MYE sin)

U.S. Brand NamesNeo-Fradin™; Neo-Rx

Pharmacologic CategoryAmmonium Detoxicant; Antibiotic, Aminoglycoside; Antibiotic, Topical

Use: Labeled IndicationsOrally to prepare GI tract for surgery; topically to treat minor skin infections; treatment of diarrhea caused by *E. coli*; adjunct in the treatment of hepatic encephalopathy; bladder irrigation; ocular infections

Dosing: Adults

Dermatologic infections: Topical: Topical solutions containing 0.1% to 1% neomycin have been used for irrigation

Preoperative intestinal antisepsis: Oral: 1 g each hour for 4 doses then 1 g every 4 hours for 5 doses; or 1 g at 1 PM, 2 PM, and 11 PM on day preceding surgery as an adjunct to mechanical cleansing of the bowel and oral erythromycin; or 6 g/day divided every 4 hours for 2-3 days

Hepatic encephalopathy: Oral: 500-2000 mg every 6-8 hours or 4-12 g/day divided every 4-6 hours for 5-6 days

Chronic hepatic insufficiency: Oral: 4 g/day for an indefinite period

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Preoperative intestinal antisepsis: Oral: Children: 90 mg/kg/day divided every 4 hours for 2 days; or 25 mg/kg at 1 PM, 2 PM, and 11 PM on the day preceding surgery as an adjunct to mechanical cleansing of the intestine and in combination with erythromycin base

Hepatic encephalopathy: Oral: Children: 50-100 mg/kg/day in divided doses every 6-8 hours or 2.5-7 g/m^2/day divided every 4-6 hours for 5-6 days not to exceed 12 g/day

Dermatologic infections: Topical: Children: Refer to adult dosing.

ContraindicationsHypersensitivity to neomycin or any component of the formulation, or other aminoglycosides; intestinal obstruction

Warnings/Precautions

Boxed warnings:

- Nephrotoxicity: See “Concerns related to adverse effects” below.
- Neuromuscular blockade and respiratory paralysis: See “Concerns related to adverse effects” below.
- Neurotoxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Nephrotoxicity: **[U.S. Boxed Warning]: May cause nephrotoxicity;** usual risk factors include pre-existing renal impairment, concomitant nephrotoxic medications, advanced age and dehydration. Discontinue treatment if signs of nephrotoxicity occur; renal damage is usually reversible.
- Neuromuscular blockade and respiratory paralysis: **[U.S. Boxed Warning]: May cause neuromuscular blockade and respiratory paralysis;** especially when given soon after anesthesia or muscle relaxants.
- Neurotoxicity: **[U.S. Boxed Warning]: May cause neurotoxicity;** usual risk factors include pre-existing renal impairment, concomitant neuro-/nephrotoxic medications, advanced age and dehydration. Ototoxicity is proportional to the amount of drug given and the duration of treatment. Tinnitus or vertigo may be indications of vestibular injury and impending bilateral irreversible damage. Discontinue treatment if signs of ototoxicity occur.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hearing impairment: Use with caution in patients with pre-existing vertigo, tinnitus, or hearing loss.
- Neuromuscular disorders: Use with caution in patients with neuromuscular disorders, including myasthenia gravis.
- Renal impairment: Use with caution in patients with pre-existing renal insufficiency; dosage modification required.

Dosage form specific issues:

- Topical: It is a contact sensitizer with sensitivity occurring in 5% to 15% of patients treated with the drug; symptoms include itching, reddening, edema, and failure to heal when used topically.

Other warnings/precautions:

- Parenteral administration: More toxic than other aminoglycosides when given parenterally; **do not administer parenterally.**

- Peritoneal lavage: **Do not use as peritoneal lavage** due to significant systemic adsorption of the drug.

Pregnancy Risk FactorD

Pregnancy ConsiderationsNeomycin crosses the placenta. Because neomycin has limited maternal absorption, the portion of an orally administered maternal dose available to cross the placenta is very low. Because of several reports of total irreversible bilateral congenital deafness in children whose mothers received streptomycin during pregnancy, the manufacturer classifies neomycin as pregnancy risk factor D. There have been no reports of fetal toxicity in humans from neomycin. No adequate and well-controlled studies have been conducted in pregnant women and it is not known whether neomycin can cause fetal harm. Although the manufacturer considers neomycin pregnancy risk factor D, neomycin-specific clinical data would suggest a pregnancy risk factor C.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsIt is not known if neomycin is excreted into breast milk; however, limited oral absorption by both the mother and infant would minimize exposure to the nursing infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Neomycin in Pregnancy & Lactation

Adverse Reactions

Oral:

>10%: Gastrointestinal: Nausea, diarrhea, vomiting, irritation or soreness of the mouth or rectal area

<1% (Limited to important or life-threatening): Dyspnea, eosinophilia, nephrotoxicity, neurotoxicity, ototoxicity (auditory), ototoxicity (vestibular)

Topical: >10%: Dermatologic: Contact dermatitis

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Monitoring ParametersRenal function tests, audiometry in symptomatic patients

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, ototoxicity, nephrotoxicity, neurotoxicity). Assess knowledge/teach patient appropriate use (application of cream/ointment), possible side effects/interventions, and adverse symptoms to report. Minimal absorption across GI mucosa or skin surfaces; however with ulceration, open or burned surfaces (especially large surfaces), absorption is possible.

Monitoring: Lab TestsRenal function; perform culture and sensitivity prior to initiating therapy.

Patient EducationOral: Take as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased exercise, fluids, fruit, or fiber may help, or consult prescriber); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report immediately any change in hearing; ringing or sense of fullness in ears; persistent diarrhea; changes in voiding patterns; or numbness, tingling, or pain in any extremity. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder, micronized, as sulfate [for prescription compounding] (Neo-Rx): (10 g, 100 g)

Solution, oral, as sulfate (Neo-Fradin™): 125 mg/5 mL (60 mL, 480 mL) [contains benzoic acid; cherry flavor]

Tablet, as sulfate: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Neomycin Sulfate)

500 mg (30): $37.99

Mechanism of ActionInterferes with bacterial protein synthesis by binding to 30S ribosomal subunits

Pharmacodynamics/Kinetics

Absorption: Oral, percutaneous: Poor (3%)

Distribution: 97% of an orally administered dose remains in the GI tract. Absorbed neomycin distributes to tissues and concentrates in the renal cortex. With repeated doses, accumulation also occurs in the inner ear.

V_d: 0.36 L/kg

Protein binding: 0% to 30%

Metabolism: Slightly hepatic

Half-life elimination (age and renal function dependent): 3 hours

Time to peak, serum: Oral: 1-4 hours

Excretion: Feces (97% of oral dose as unchanged drug); urine (30% to 50% of absorbed drug as unchanged drug)

Related Information

- Prevention of Wound Infection and Sepsis in Surgical Patients

Medication Safety Issues

Sound-alike/look-alike issues:

Prostigmin® may be confused with physostigmine

Pronunciation(nee oh STIG meen)

U.S. Brand NamesProstigmin®

Canadian Brand NamesProstigmin®

Pharmacologic CategoryAcetylcholinesterase Inhibitor

Use: Labeled IndicationsDiagnosis and treatment of myasthenia gravis; prevention and treatment of postoperative bladder distention and urinary retention; reversal of the effects of nondepolarizing neuromuscular-blocking agents after surgery

Dosing: Adults

Myasthenia gravis, diagnosis: I.M.: 0.02 mg/kg as a single dose

Myasthenia gravis, treatment:

Oral: 15 mg/dose every 3-4 hours up to 375 mg/day maximum; interval between doses must be individualized to maximal response

I.M., I.V., SubQ: 0.5-2.5 mg every 1-3 hours up to 10 mg/24 hours maximum

Reversal of nondepolarizing neuromuscular blockade after surgery in conjunction with atropine: I.V.: 0.5-2.5 mg; total dose not to exceed 5 mg; must administer atropine several minutes prior to neostigmine

Bladder atony: I.M., SubQ:

Prevention: 0.25 mg every 4-6 hours for 2-3 days

Treatment: 0.5-1 mg every 3 hours for 5 doses after bladder has emptied

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Myasthenia gravis, diagnosis: I.M.: Children: 0.04 mg/kg as a single dose

Myasthenia gravis, treatment: Children:

Oral: 2 mg/kg/day divided every 3-4 hours

I.M., I.V., SubQ: 0.01-0.04 mg/kg every 2-4 hours

Reversal of nondepolarizing neuromuscular blockade after surgery in conjunction with atropine (must administer atropine several minutes prior to neostigmine): I.V.:

Infants: 0.025-0.1 mg/kg/dose

Children: 0.025-0.08 mg/kg/dose

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 50% of normal dose.

Cl_{cr} <10 mL/minute: Administer 25% of normal dose.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.In the diagnosis of myasthenia gravis, all anticholinesterase medications should be discontinued for at least 8 hours before administering neostigmine.

Administration: I.V. DetailpH: 5.9 (adjusted)

CompatibilityStable in NS.

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Compatibility in syringe: Compatible: Glycopyrrolate, heparin, ondansetron, pentobarbital, thiopental.

ContraindicationsHypersensitivity to neostigmine, bromides, or any component of the formulation; GI or GU obstruction

Allergy Considerations

- Cholinesterase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anticholinesterase insensitivity: For brief or prolonged periods, anticholinesterase insensitivity can develop.
- Cholinergic effects: Discontinue if symptoms of excess cholinergic activity (eg, salivation, sweating, urinary incontinence); overdosage may result in cholinergic crisis, which must be distinguished from myasthenic crisis.
- Hypersensitivity reactions: Have atropine and epinephrine ready to treat hypersensitivity reactions.

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Cardiovascular disease: Use with caution in patients with bradycardia and cardiac arrhythmias.
- GI disease: Use with caution in patients with GI disease, including peptic ulcer disease.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Myasthenia gravis: Adequate facilities should be available for cardiopulmonary resuscitation when testing and adjusting dose for myasthenia gravis.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Vagotonia: Not generally recommended for use in patients with vagotonia.

Concurrent drug therapy issues:

- Muscle relaxants: Does **not** antagonize and may prolong the Phase I block of depolarizing muscle relaxants (eg, succinylcholine).

Geriatric ConsiderationsMany elderly will have diseases which may influence the use of neostigmine. Also, many elderly will need doses reduced 50% due to creatinine clearances in the 10-50 mL/minute range (common in the aged). Side effects or concomitant disease may warrant use of pyridostigmine.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias (especially bradycardia), hypotension, tachycardia, AV block, nodal rhythm, nonspecific ECG changes, cardiac arrest, syncope, flushing

Central nervous system: Convulsions, dysarthria, dysphonia, dizziness, loss of consciousness, drowsiness, headache

Dermatologic: Skin rash, thrombophlebitis (I.V.), urticaria

Gastrointestinal: Hyperperistalsis, nausea, vomiting, salivation, diarrhea, stomach cramps, dysphagia, flatulence

Genitourinary: Urinary urgency

Neuromuscular & skeletal: Weakness, fasciculations, muscle cramps, spasms, arthralgia

Ocular: Small pupils, lacrimation

Respiratory: Increased bronchial secretions, laryngospasm, bronchiolar constriction, respiratory muscle paralysis, dyspnea, respiratory depression, respiratory arrest, bronchospasm

Miscellaneous: Diaphoresis increased, anaphylaxis, allergic reactions

Drug Interactions

Beta-Blockers: Acetylcholinesterase Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Cholinergic Agonists: Acetylcholinesterase Inhibitors may enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Acetylcholinesterase Inhibitors may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Succinylcholine: Acetylcholinesterase Inhibitors may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringUsed for MG diagnosis by prescribers. For bladder atony, assess bladder adequacy prior to administering medication. Monitor therapeutic effectiveness and adverse effects (including cholinergic crisis). Teach patient symptoms to report.

Patient EducationTake this drug exactly as prescribed. You may experience visual difficulty (eg, blurring and dark adaptation, use caution at night) or urinary frequency. Promptly report any muscle weakness, respiratory difficulty, severe or unresolved diarrhea, persistent abdominal cramping or vomiting, sweating, or tearing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as methylsulfate: 0.5 mg/mL (1 mL, 10 mL); 1 mg/mL (10 mL)

Tablet, as bromide: 15 mg

Generic AvailableYes: Injection

Mechanism of ActionInhibits destruction of acetylcholine by acetylcholinesterase which facilitates transmission of impulses across myoneural junction

Pharmacodynamics/Kinetics

Onset of action: I.M.: 20-30 minutes; I.V.: 1-20 minutes

Duration: I.M.: 2.5-4 hours; I.V.: 1-2 hours

Absorption: Oral: Poor, <2%

Metabolism: Hepatic

Half-life elimination: Normal renal function: 0.5-2.1 hours; End-stage renal disease: Prolonged

Excretion: Urine (50% as unchanged drug)

Pharmacotherapy PearlsIn the diagnosis of myasthenia gravis, all anticholinesterase medications should be discontinued for at least 8 hours before administering neostigmine.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause drowsiness, restlessness, or agitation

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsNeostigmine has occasionally been used to improve gastrointestinal motility. Researchers from Amsterdam evaluated a neostigmine infusion (0.4-0.8 mg/hour over 24 hours) in patients with critical illness-related colonic ileus in a randomized, placebo-controlled, double-blind manner (van der Spoel, 2001). Twenty four ICU patients were evaluated and 13 patients initially received neostigmine. Eleven of the patients in the active treatment group passed stools whereas none of the placebo group did. The median time to defecation was 6 hours. None of the patients had the infusion stopped or reduced because of adverse events. Three patients had an increase in saliva and sputum production. No cardiac complications were observed. Three patients developed ischemic colon 7-10 days after treatment. No difference was found in APACHE scores between patients with colonic ischemia and those without, but the median dopamine dose was significantly higher (16 mcg/kg/minute) in patients with ischemia than those without (8 mcg/kg/minute).

Ponec and his associates (1999) studied the use of a single intravenous dose of neostigmine (2 mg over 3-5 minutes) in 21 surgical or medical patients with acute colonic pseudo-obstruction (cecal diameter >10 cm). Patients were randomized to receive neostigmine or placebo and a blinded physician evaluated their responses. Patients received continuous ECG monitoring and atropine was immediately available for treatment of bradycardia. Ten of the 11 patients receiving neostigmine had prompt colonic decompression with a median time to response of 4 minutes. Two that had an initial response to neostigmine required colonic decompression for recurrence of distention. Adverse events included abdominal pain, excessive salivation, and vomiting. In addition, 2 patients had symptomatic bradycardia requiring atropine.

Index TermsNeostigmine Bromide; Neostigmine Methylsulfate

Nepafenac

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ne pa FEN ak)
U.S. Brand NamesNevanac™
Canadian Brand NamesNevanac™
Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Ophthalmic
Use: Labeled IndicationsTreatment of pain and inflammation associated with cataract surgery
Dosing: Adults**Pain, inflammation associated with cataract surgery:** Ophthalmic: Instill 1 drop into affected eye(s) 3 times/day, beginning 1 day prior to surgery, the day of surgery, and through the first 2 weeks of the postoperative period
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Pain, inflammation associated with cataract surgery:** Ophthalmic: Children ≥10 years: Refer to adult dosing.
Administration: Other

Ophthalmic: Shake well prior to use.

StorageStore at 2°C to 25˚C (36°F to 77˚F).
ContraindicationsHypersensitivity to nepafenac, other NSAIDs, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Aspirin/NSAID sensitivity: Use with caution in patients with previous sensitivity to acetylsalicylic acid and phenylacetic acid derivatives, including patients who experience bronchospasm, asthma, rhinitis, or urticaria following NSAID or aspirin.
- Keratitis: May cause keratitis; continued use in a patient with keratitis may cause severe corneal adverse reactions, potentially resulting in loss of vision. Immediately discontinue use in patients with evidence of corneal epithelial damage.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with a predisposition to bleeding (bleeding tendencies or medications which interfere with coagulation).
- Diabetes: Use with caution in patients with diabetes mellitus; may be at risk of corneal adverse events, potentially resulting in loss of vision.
- Ocular disease: Use with caution in patients with complicated ocular surgeries, corneal denervation, corneal epithelial defects, ocular surface disease, or repeat ocular surgeries (within a short timeframe); may be at risk of corneal adverse events, potentially resulting in loss of vision.
- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may be at risk of corneal adverse events, potentially resulting in loss of vision.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <10 years of age.
- Surgery patients: May slow/delay healing or prolong bleeding time following surgery.

Other warnings/precautions:

- Duration of therapy: Use for more than 1 day prior to surgery or for 14 days beyond surgery may increase risk and severity of corneal adverse events.
- Soft contact lenses: Patients using ophthalmic drops should not wear soft contact lenses.

Geriatric ConsiderationsNo differences in safety and efficacy noted between elderly and younger adults. No dosage adjustment necessary. Elderly may be taking other medications that will increase bleeding.
Pregnancy Risk FactorC/D (3rd trimester)
Pregnancy ConsiderationsTeratogenic events were not observed in animal studies. Safety and efficacy in pregnant women have not been established. Exposure to nonsteroidal anti-inflammatory drugs late in pregnancy may lead to premature closure of the ductus arteriosus.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions1% to 10%:

Cardiovascular: Hypertension (1% to 4%)

Central nervous system: Headache (1% to 4%)

Gastrointestinal: Nausea (1% to 4%), vomiting (1% to 4%)

Ocular: Capsular opacity (5% to 10%), foreign body sensation (5% to 10%), intraocular pressure increased (5% to 10%), sticky sensation (5% to 10%), visual acuity decreased (5% to 10%), conjunctival edema (1% to 5%), corneal edema (1% to 5%), dry eye (1% to 5%), lid margin crusting (1% to 5%), ocular discomfort (1% to 5%), ocular hyperemia (1% to 5%), ocular pain (1% to 5%), ocular pruritus (1% to 5%), photophobia (1% to 5%), tearing (1% to 5%), vitreous detachment (1% to 5%)

Respiratory: Sinusitis (1% to 4%)

Drug Interactions

Latanoprost: NSAID (Ophthalmic) may diminish the therapeutic effect of Latanoprost. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Patient EducationOphthalmic: Instill drops as often as recommended. Wash hands before instilling. Sit or lie down to instill. Open eye, look at the ceiling, and instill prescribed amount. Close eye and roll eye in all directions. Apply gentle pressure to inner corner of eye for 1-2 minutes after instillation. Do not wear soft contract lenses while using this medication. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, ophthalmic: 0.1% (3 mL) [contains benzalkonium chloride]

Generic AvailableNo

ManufacturerAlcon Laboratories

Pricing: U.S. (www.drugstore.com)

Suspension (Nevanac)

0.1% (3): $92.14

Mechanism of ActionNepafenac is a prodrug which once converted to amfenac inhibits prostaglandin synthesis by decreasing the activity of the enzyme, cyclooxygenase, which results in decreased formation of prostaglandin precursors.

Pharmacodynamics/Kinetics

Absorption: Low levels (0.2-0.5 ng/mL) of nepafenac and amfenac are detected in the plasma following ophthalmic administration

Metabolism: Hydrolyzed in ocular tissue to amfenac (active)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

International issues:

Natrecor® may be confused with Nitrocor® which is a brand name for nitroglycerin in Chile and Italy

Pronunciation(ni SIR i tide)
U.S. Brand NamesNatrecor®
Canadian Brand NamesNatrecor®
Pharmacologic CategoryNatriuretic Peptide, B-type, Human
Use: Labeled IndicationsTreatment of acutely decompensated congestive heart failure (CHF) in patients with dyspnea at rest or with minimal activity
Dosing: Adults

Acute decompensated heart failure: I.V.: Initial: 2 mcg/kg (bolus); followed by continuous infusion at 0.01 mcg/kg/minute. **Note:** Should not be initiated at a dosage higher than initial recommended dose. There is limited experience with increasing the dose >0.01 mcg/kg/minute; in one trial, a limited number of patients received higher doses that were increased no faster than every 3 hours by 0.005 mcg/kg/minute (preceded by a bolus of 1 mcg/kg), up to a maximum of 0.03 mcg/kg/minute. Increases beyond the initial infusion rate should be limited to selected patients and accompanied by close hemodynamic and renal function monitoring.

Patients experiencing hypotension during the infusion: Infusion dose should be reduced or discontinued. Other measures to support blood pressure should be initiated (eg, I.V. fluids, Trendelenburg position). May attempt to restart at a lower dose (reduce previous infusion dose by 30% and omit bolus).

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment required but use cautiously in patients with renal impairment or those patients who rely on the renin-angiotensin-aldosterone system for renal perfusion. Monitor renal function closely.
Dosing: Hepatic Impairment

No dosage adjustment recommended.

Calculations

- Nesiritide

Administration: I.V.Do not administer through a heparin-coated catheter (concurrent administration of heparin via a separate catheter is acceptable, per manufacturer).
Administration: I.V. DetailPrime I.V. tubing with 5 mL of infusion prior to connection with vascular access port and prior to administering bolus or starting the infusion. Withdraw bolus from the prepared infusion bag and administer over 60 seconds. Begin infusion immediately following administration of the bolus.
StorageVials may be stored below 25°C (77°F); do not freeze. Protect from light. Following reconstitution, vials are stable at 2°C to 25°C (36°F to 77°F) for up to 24 hours. Use reconstituted solution within 24 hours.
ReconstitutionReconstitute 1.5 mg vial with 5 mL of diluent removed from a preprefilled 250 mL plastic I.V. bag (compatible with D_5W, $D_5{}^1/_2NS$, $D_5{}^1/_4NS$, NS). Do not shake vial to dissolve (roll gently). Withdraw entire contents of vial and add to 250 mL I.V. bag. Invert several times to mix. Resultant concentration of solution is ~6 mcg/mL.
CompatibilityStable in D_5W, $D_5{}^1/_2NS$, $D_5{}^1/_4NS$, NS.

Physically **incompatible** with heparin, insulin, ethacrynate sodium, bumetanide, enalaprilat, hydralazine, and furosemide. Do not administer through the same catheter. Do not administer with any solution containing sodium metabisulfite. Catheter must be flushed between administration of nesiritide and physically incompatible drugs.

ContraindicationsHypersensitivity to natriuretic peptide or any component of the formulation; cardiogenic shock (when used as primary therapy); hypotension (systolic blood pressure <90 mm Hg)
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic/hypersensitivity reactions: Prepared through recombinant technology using *E. coli*; monitor for allergic or anaphylactic reactions.
- Hypotension: May cause hypotension; administer in clinical situations when blood pressure may be closely monitored. Use caution in patients with systolic blood pressure <100 mm Hg (contraindicated if <90 mm Hg); more likely to experience hypotension. Effects may

be additive with other agents capable of causing hypotension. Hypotensive effects may last for several hours.

- Renal effects: May be associated with development of azotemia; use caution in patients with renal impairment or in patients where renal perfusion is dependent on renin-angiotensin-aldosterone system (eg, severe heart failure); avoid initiation at doses higher than recommended; increases in serum creatinine may occur at an elevated rate.

Disease-related concerns:

- Cardiovascular disease: Should not be used in patients with low cardiac filling pressures, or in patients with conditions which depend on venous return including significant valvular stenosis, restrictive or obstructive cardiomyopathy, constrictive pericarditis, and pericardial tamponade.

- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Prolonged infusions: Use caution with prolonged infusions; limited experience for infusions >48 hours.

Geriatric ConsiderationsNo specific data to date; elderly are liable to have hypotension, see Warnings/Precautions for blood pressure criteria. Elderly with reduced renal function should be monitored closely.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse Reactions**Note:** Frequencies cited below were recorded in VMAC trial at dosages similar to approved labeling. Higher frequencies have been observed in trials using higher dosages of nesiritide. The percentages marked with an asterisk (*) indicate frequency less than or equal to placebo or other standard therapy.

>10%:

Cardiovascular: Hypotension (total: 11%; symptomatic: 4% at recommended dose, up to 17% at higher doses)

Renal: Increased serum creatinine (28% with >0.5 mg/dL increase over baseline)

1% to 10%:

Cardiovascular: Ventricular tachycardia (3%)*, ventricular extrasystoles (3%)*, angina (2%)*, bradycardia (1%), tachycardia, atrial fibrillation, AV node conduction abnormalities

Central nervous system: Headache (8%)*, dizziness (3%)*, insomnia (2%)*, anxiety (3%), fever, confusion, paresthesia, somnolence, tremor

Dermatologic: Pruritus, rash

Gastrointestinal: Nausea (4%)*, abdominal pain (1%)*, vomiting (1%)*

Hematologic: Anemia

Local: Injection site reaction

Neuromuscular & skeletal: Back pain (4%), leg cramps

Ocular: Amblyopia

Respiratory: Cough increased, hemoptysis, apnea

Miscellaneous: Diaphoresis increased

Postmarketing and/or case reports: Hypersensitivity reactions (rare)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, and licorice (may increase blood pressure). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, and shepherd's purse (may enhance decreased blood pressure).

Monitoring ParametersBlood pressure, hemodynamic responses (PCWP, RAP, CI), BUN, creatinine; urine output

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, other hypotensive agents or diuretics). Blood pressure and cardiac function should be monitored before and at frequent intervals during and for 24 hours following infusion (hemodynamic monitoring with larger doses). Assess results of laboratory tests, renal function, and patient response on a regular basis throughout therapy (eg, hypersensitivity, hypotension). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationThis medication can only be administered by infusion; you will be monitored closely during and following infusion. Report immediately any pain, burning, swelling at infusion site, or any signs of allergic reaction (eg, respiratory or swallowing difficulty, back pain, chest tightness, rash, hives, swelling of lips or mouth). Remain in bed until advised otherwise; call for assistance with turning or changing position. Report any chest pain, respiratory difficulty, confusion, nausea, leg cramps, swelling of extremities, sudden or excessive weight gain, or any other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Natrecor®: 1.5 mg

Generic AvailableNo

ManufacturerScios

Mechanism of ActionBinds to guanylate cyclase receptor on vascular smooth muscle and endothelial cells, increasing intracellular cyclic GMP, resulting in smooth muscle cell relaxation. Has been shown to produce dose-dependent reductions in pulmonary capillary wedge pressure (PCWP) and systemic arterial pressure.

Pharmacodynamics/Kinetics

Onset of action: 15 minutes (60% of 3-hour effect achieved)

Duration: >60 minutes (up to several hours) for systolic blood pressure; hemodynamic effects persist longer than serum half-life would predict

Distribution: V_{ss}: 0.19 L/kg

Metabolism: Proteolytic cleavage by vascular endopeptidases and proteolysis following receptor binding and cellular internalization

Half-life elimination: Initial (distribution) 2 minutes; Terminal: 18 minutes

Time to peak: 1 hour

Excretion: Urine

Pharmacotherapy PearlsThe duration of symptomatic improvement with nesiritide following discontinuation of the infusion has been limited (generally lasting several days). Atrial natriuretic peptide, which is related to nesiritide, has been associated with increased vascular permeability. This has not been observed in clinical trials with nesiritide, but patients should be monitored for this effect.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation, insomnia, anxiety, or confusion

Mental Health: Effects on Psychiatric TreatmentMay cause hypotension; use caution with antipsychotics and TCAs. May cause cardiac conduction abnormalities; use caution with TCAs and ziprasidone.

Cardiovascular ConsiderationsA retrospective review evaluated the renal effects of nesiritide in acutely decompensated heart failure (ADHF) (Sackner-Bernstein, 2005). It included randomized clinical trials comparing nesiritide with placebo (or an active control). Worsening renal function was defined as an increase in serum creatinine >0.5 mg/dL. Five randomized studies (1269 patients) were reviewed. Use of nesiritide in the doses outlined by the FDA significantly increased the risk of worsening renal function compared with noninotrope based controls.

These investigators performed a meta-analysis of randomized clinical trials comparing the safety of nesiritide to noninotrope based controls in ADHF (Sackner-Bernstein, 2005). There were 3 trials (485 patients) which met the criteria. Death within 30 days tended to occur more often among patient randomized to nesiritide therapy. The authors concluded that the possibility of increased risk of death with nesiritide should be investigated in a large-scale trial.

Scios released a “Dear Healthcare Provider” letter on July 18, 2005, to provide information regarding an expert panel’s review of nesiritide. Here are their final recommendations: The use of nesiritide should be strictly limited to patients presenting to the hospital with acutely decompensated heart failure who have dyspnea at rest. Nesiritide should not be used to replace diuretics, to enhance diuresis, to improve renal function, for intermittent outpatient infusion, or for scheduled repetitive use.

Additional information is available at http://www.fda.gov/medwatch/safety/2005/safety05.htm#Natrecor2, last accessed July 19, 2005.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Nevirapine may be confused with nelfinavir

Viramune® may be confused with Viracept®

Pronunciation(ne VYE ra peen)

U.S. Brand NamesViramune®

Canadian Brand NamesViramune®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Non-nucleoside)

Use: Labeled IndicationsIn combination therapy with other antiretroviral agents for the treatment of HIV-1

Dosing: Adults

HIV infection: Oral: Initial: 200 mg once daily for 14 days; maintenance: 200 mg twice daily (in combination with an additional antiretroviral agents).

Note: If patient experiences a rash during the 14-day lead-in period, dose should not be increased until the rash has resolved. Lead-in period should not exceed 28 days; alternative treatment should be considered at that point. Discontinue if severe rash, rash with constitutional symptoms, or rash with elevated hepatic transaminases is noted. Use of prednisone to prevent nevirapine-associated rash is not recommended. Permanently discontinue if symptomatic hepatic events occur. If therapy is interrupted for >7 days, restart with initial dose for 14 days.

Prevention of maternal-fetal HIV transmission (AIDSinfo guidelines): Note: Nevirapine is used in combination with zidovudine (and possibly lamivudine) in select situations (eg, infants born to mothers with suboptimal viral suppression at delivery, infants born to mothers with only intrapartum therapy or no therapy, or infants born to mothers with known antiretroviral drug-resistant virus)

Mother: 200 mg as a single dose at onset of labor

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

HIV infection: Oral:

Infants ≥15 days and Children <13 years: 150 mg/m^2 once daily for first 14 days (maximum dose: 200 mg/day); increase dose to 150 mg/m^2 twice daily if no rash or untoward effects (maximum dose: ≤400 mg/day). Children ≤8 years of age: May require 200 mg/m^2 twice daily.

Adolescents: Refer to adult dosing.

Note: If patient experiences a rash during the 14-day lead-in period, dose should not be increased until the rash has resolved. Lead-in period should not exceed 28 days; alternative treatment should be considered at that point. Discontinue if severe rash, rash with constitutional symptoms, or rash with elevated hepatic transaminases is noted. Use of prednisone to prevent nevirapine-associated rash is not recommended. Permanently discontinue if symptomatic hepatic events occur. If therapy is interrupted for >7 days, restart with initial dose for 14 days.

Prevention of maternal-fetal HIV transmission (AIDSinfo guidelines): Note: Nevirapine is used in combination with zidovudine (and possibly lamivudine) in select situations (eg, infants born to mothers with suboptimal viral suppression at delivery, infants born to mothers with only intrapartum therapy or no therapy, or infants born to mothers with known antiretroviral drug-resistant virus)

Neonate: 2 mg/kg as a single dose between birth and 72 hours if mother received intrapartum dose of nevirapine. If maternal dose was given ≤2 hours prior to delivery, administer infant dose as soon as possible following birth.

Dosing: Renal Impairment

Cl_{cr} ≥20 mL/minute: No adjustment required

Hemodialysis: An additional 200 mg dose is recommended following dialysis.

Dosing: Hepatic ImpairmentUse is contraindicated with moderate-to-severe hepatic impairment. Permanently discontinue if symptomatic hepatic events.

Administration: OralMay be administered with or without food. May be administered with an antacid or didanosine. Shake suspension gently prior to administration.

StorageStore at 25°C (77°F); excursion permitted to 15°C to 30˚C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to nevirapine or any component of the formulation; moderate-to-severe hepatic impairment (Child-Pugh class B or C)

Allergy Considerations

- Nevirapine Allergy

Warnings/Precautions

Boxed warnings:

- Hepatotoxicity: See “Concerns related to adverse effects” below.
- Skin reactions: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hepatotoxicity: **[U.S. Boxed Warning]: Severe hepatotoxic reactions may occur (fulminant and cholestatic hepatitis, hepatic necrosis) and, in some cases, have resulted in hepatic failure and death.** The greatest risk of these reactions is within the initial 6 weeks of treatment; **intensive monitoring is required during the initial 18 weeks of therapy to detect potentially life-threatening hepatic reactions.** Patients with a history of chronic hepatitis (B or C) or increased baseline transaminase levels may be at increased risk of hepatotoxic reactions. Female gender and patients with increased CD4$^+$-cell counts may be at substantially greater risk of hepatic events (often associated with rash). Therapy should not be started with elevated CD4$^+$-cell counts unless the benefit of therapy outweighs the risk of serious hepatotoxicity (females: CD4$^+$-cell counts >250 cells/mm^3; males: CD4$^+$-cell counts >400 cells/mm^3). If signs and symptoms of hepatitis occur, nevirapine should be permanently discontinued with immediate evaluation of liver function.
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Rhabdomyolysis: Has been observed in conjunction with skin and/or hepatic adverse events during postmarketing surveillance. Termination of therapy is warranted with evidence of severe skin or liver toxicity.
- Skin reactions: **[U.S. Boxed Warning]: Severe life-threatening skin reactions (eg, Stevens-Johnson syndrome, toxic epidermal necrolysis, hypersensitivity reactions with rash and organ dysfunction) have occurred;intensive monitoring is required during the initial 18 weeks of therapy to detect potentially life-threatening dermatologic and hypersensitivity reactions.** If a severe dermatologic or hypersensitivity reaction occurs, nevirapine should be permanently discontinued; these events may include a severe rash, or a rash associated with fever, blisters, oral lesions, conjunctivitis, facial edema, muscle or joint aches, transaminase increases, general malaise, hepatitis, eosinophilia, granulocytopenia, lymphadenopathy, or renal dysfunction. Use of the 14-day lead-in dosing period is necessary to decrease the incidence of rash events. If nonsevere rash (in absence of transaminase elevations) occurs, do not increase dose until resolution of rash.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Other warnings/precautions:

- Appropriate use: A 14-day lead-in dose should be used to decrease risk of skin reactions. An alternative regimen should be used if the lead-in dose exceeds 28 days.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNevirapine crosses the placenta. No increased risk of overall birth defects has been observed following 1st trimester exposure according to data collected by the antiretroviral pregnancy registry. Pharmacokinetics are not altered during pregnancy and dose adjustment is not needed. The Perinatal HIV Guidelines Working Group recommends nevirapine as the NNRTI for use during pregnancy. When used to prevent perinatal transmission in women who do not need therapy for their own health, use is not recommended if CD4$^+$ lymphocyte counts >250/mm^3 (monitor for liver toxicity during first 18 weeks of therapy). It may also be used in combination with zidovudine in HIV-infected women who are in labor, but have had no prior antiretroviral therapy, in order to reduce the maternal-fetal transmission of HIV; consider adding intrapartum and postpartum zidovudine and lamivudine to reduce nevirapine resistance. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions**Note:** Potentially life-threatening nevirapine-associated adverse effects may present with the following symptoms: Abrupt onset of flu-like symptoms, abdominal pain, jaundice, or fever with or without rash; may progress to hepatic failure with encephalopathy. Skin rash is present in ~50% of cases.

Percentages of adverse effects vary by clinical trial:

>10%:

Dermatologic: Rash (grade 1/2: 13%; grade 3/4: 1.5%) is the most common toxicity; occurs most frequently within the first 6 weeks of therapy; women may be at higher risk than men

Hepatic: ALT >250 units/L (5% to 14%); symptomatic hepatic events (4%, range: up to 11%) are more common in women, women with CD4$^+$ cell counts >250 cells/mm^3, and men with CD4$^+$ cell counts >400 cells/mm^3

1% to 10%:

Central nervous system: Headache (1% to 4%), fatigue (up to 5%)

Gastrointestinal: Nausea (<1% to 9%), abdominal pain (<1% to 2%), diarrhea (up to 2%)

Hepatic: AST >250 units/L (4% to 8%); coinfection with hepatitis B or C and/or increased liver function tests at the beginning of therapy are associated with a greater risk of asymptomatic transaminase elevations (ALT or AST >5 times ULN: 6%, range: up to 9%) or symptomatic events occurring ≥6 weeks after beginning treatment

Postmarketing and/or case reports: Allergic reactions, anaphylaxis, anemia, angioedema, arthralgia, blisters, bullous eruptions, conjunctivitis, eosinophilia, facial edema, fever, fulminant and cholestatic hepatitis, granulocytopenia, hepatic failure, hepatic necrosis, hypersensitivity syndrome, jaundice, lymphadenopathy, malaise, neutropenia, oral lesions, paresthesia, redistribution/accumulation of body fat, renal dysfunction, rhabdomyolysis, Stevens-Johnson syndrome, somnolence, toxic epidermal necrolysis, ulcerative stomatitis, urticaria, vomiting

Metabolism/Transport Effects **Substrate** of CYP2B6 (minor), 2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2D6 (weak), 3A4 (weak); **Induces** CYP2B6 (strong), 3A4 (strong)

Drug Interactions

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: Reverse Transcriptase Inhibitors (Non-Nucleoside) may decrease the serum concentration of Etravirine. This has been observed with the NNRTIs efavirenz and nevirapine. Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the serum concentration of Etravirine. This has been observed with delavirdine. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Protease Inhibitors: Nevirapine may increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifabutin: May decrease the serum concentration of Nevirapine. Nevirapine may decrease the serum concentration of Rifabutin. Nevirapine may increase the serum concentration of Rifabutin. *Risk C: Monitor therapy*

Rifampin: May decrease the serum concentration of Nevirapine. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Voriconazole: Reverse Transcriptase Inhibitors (Non-Nucleoside) may decrease the serum concentration of Voriconazole. Voriconazole may increase the serum concentration of Reverse Transcriptase Inhibitors (Non-Nucleoside). Management: Efavirenz and voriconazole should not be coadministered at standard doses. Concurrent therapy is acceptable if voriconazole is dosed at 400 mg every 12 hours and efavirenz is dosed at 300 mg daily throughout the course of therapy. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: Nevirapine serum concentration may be decreased by St John's wort; avoid concurrent use.

Monitoring Parameters Monitor CBC and viral load. Baseline liver function tests should be obtained prior to nevirapine's initiation. AIDS guidelines recommend serum transaminase monitoring every 2 weeks for the first 4 weeks of therapy, then monthly for 3 months, followed by every 3-4 months. Assess/evaluate AST/ALT immediately in any patients with a rash. Permanently discontinue if patient experiences severe rash, constitutional symptoms associated with rash, rash with elevated AST/ALT, or clinical hepatitis, Mild-to-moderate rash without AST/ALT elevation may continue treatment per discretion of prescriber. If mild-to-moderate urticarial rash, do not restart if treatment is interrupted.

Nursing: Physical Assessment/Monitoring Use caution in presence of or history of hepatic disease. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments may be necessary. Patient response should be followed closely during 14-day lead-in dosing period to assess for hypersensitivity prior to increasing daily dose. Assess results of laboratory tests (especially LFTs at baseline and frequently during therapy). Assess patient regularly and frequently during initial 18 weeks of therapy to identify any symptoms of hypersensitivity (hepatic and or dermatologic reactions which may include severe rash, rash with fever, blisters, oral lesions, conjunctivitis, facial edema, muscle or joint aches, general malaise, jaundice, hepatitis, or renal dysfunction). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor CBC and viral load. Baseline liver function tests should be obtained prior to nevirapine's initiation. AIDS guidelines recommend serum transaminase monitoring every 2 weeks for the first 4 weeks of therapy, then monthly for 3 months, followed by every 3-4 months. Assess/evaluate AST/ALT immediately in any patients with a rash. Permanently discontinue if patient experiences severe rash, constitutional symptoms associated with rash, rash with elevated AST/ALT, or clinical hepatitis, Mild-to-moderate rash without AST/ALT elevation may continue treatment per discretion of prescriber. If mild-to-moderate urticarial rash, do not restart if treatment is interrupted.

Patient EducationYou will be provided with an FDA-approved medication guide with your prescription: Read this guide carefully. Do not take any new prescription, over-the-counter medications, or herbal products during therapy (without consulting prescriber). This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. Take as directed, with food. Shake suspension gently prior to use. When using dosing cups, rinse cup with water and drink. If you miss a dose, take as soon as possible and return to regular schedule (never take a double dose). Frequent blood tests may be required with prolonged therapy. If rash, blisters, or facial edema develops, stop medicine and contact prescriber immediately. Report any change in urinary pattern, dark urine or light stool, easy bleeding, unusual fatigue, flu-like symptoms, abdominal pain, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Effectiveness of oral contraceptives may be decreased; consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral:

Viramune®: 50 mg/5 mL (240 mL)

Tablet:

Viramune®: 200 mg

Generic AvailableNo

ManufacturerBoehringer Ingelheim Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Viramune)

200 mg (60): $472.75

Mechanism of ActionAs a non-nucleoside reverse transcriptase inhibitor, nevirapine has activity against HIV-1 by binding to reverse transcriptase. It consequently blocks the RNA-dependent and DNA-dependent DNA polymerase activities including HIV-1 replication. It does not require intracellular phosphorylation for antiviral activity.

Pharmacodynamics/Kinetics

Absorption: >90%

Distribution: Widely; V_d: 1.2-1.4 L/kg; CSF penetration approximates 40% to 50% of plasma

Protein binding, plasma: 60%

Metabolism: Extensively hepatic via CYP3A4 (hydroxylation to inactive compounds); may undergo enterohepatic recycling

Half-life elimination: Decreases over 2- to 4-week time with chronic dosing due to autoinduction (ie, half-life = 45 hours initially and decreases to 25-30 hours)

Time to peak, serum: 2-4 hours

Excretion: Urine (~81%, primarily as metabolites, <3% as unchanged drug); feces (~10%)

- Perinatal HIV Guidelines

Pharmacotherapy PearlsPotential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance. Early virologic failure was observed with tenofovir and didanosine delayed release capsules, plus either efavirenz or nevirapine; use caution in treatment-naive patients with high baseline viral loads.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Ulcerative stomatitis and oral lesions.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNeutropenia is common; avoid clozapine and carbamazepine

Pharmacologic CategoryChemotherapy Regimen, Breast Cancer

Regimen UseBreast cancer

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Mitoxantrone: I.V.: 12 mg/m^2 day 1

[total dose/cycle = 12 mg/m^2]

Fluorouracil: I.V.: 350 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 1050 mg/m^2]

Leucovorin: I.V.: 300 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 900 mg/m^2]

Repeat cycle every 21 days

Variation 2:

Mitoxantrone: I.V.: 10 mg/m^2 day 1

[total dose/cycle = 10 mg/m^2]

Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 3000 mg/m^2]

Leucovorin: I.V.: 100 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 300 mg/m^2]

Repeat cycle every 21 days

Niacin and Lovastatin

Special Alerts

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Colman E, Szarfman A, Wyeth J, et al, "An Evaluation of a Data Mining Signal for Amyotrophic Lateral Sclerosis and Statins Detected in FDA's Spontaneous Adverse Event Reporting System," *Pharmacoepidemiol Drug Saf*, 2008 (epub ahead of print)

Medication Safety Issues

Sound-alike/look-alike issues:

Advicor® may be confused with Advair, Altocor™

Pronunciation(NYE a sin & LOE va sta tin)

U.S. Brand NamesAdvicor®

Canadian Brand NamesAdvicor®

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor; Antilipemic Agent, Miscellaneous

Use: Labeled IndicationsFor use when treatment with both extended-release niacin and lovastatin is appropriate in combination with a standard cholesterol-lowering diet:

Extended-release niacin: Adjunctive treatment of dyslipidemias (types IIa and IIb or primary hypercholesterolemia) to lower the risk of recurrent MI and/or slow progression of coronary artery disease, including combination therapy with other antidyslipidemic agents when additional triglyceride-lowering or HDL-increasing effects are desired; treatment of hypertriglyceridemia in patients at risk of pancreatitis

Lovastatin: Treatment of primary hypercholesterolemia (Frederickson types IIa and IIb); primary and secondary prevention of cardiovascular disease

Dosing: AdultsDosage forms are a fixed combination of niacin and lovastatin.

Dyslipidemia: Oral: Lowest dose: Niacin 500 mg/lovastatin 20 mg; may increase by not more than 500 mg (niacin) at 4-week intervals (maximum dose: niacin 2000 mg/lovastatin 40 mg daily); should be taken at bedtime with a low-fat snack. **Note:** If therapy is interrupted for >7 days, reinstitution of therapy should begin with the lowest dose followed by retitration as needed.

Not for use as initial therapy of dyslipidemias. May be substituted for equivalent dose of Niaspan®, however, manufacturer does not recommend direct substitution with other niacin products.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild-to-moderate impairment: No dosage adjustment required

Cl_{cr} <30 mL/minute: Use doses of lovastatin >20 mg/day with caution

Dosing: Hepatic ImpairmentDo not use in active liver disease or unexplained persistent elevations of serum transaminases.

Administration: OralTablet must be swallowed whole; do not crush or chew. Should be taken with a low-fat snack at bedtime.

Dietary ConsiderationsContinue standard cholesterol-lowering diet during therapy. Should be taken with a low-fat snack.

StorageStore at 20°C to 25°C (68°F to 77°F).

Contraindications Hypersensitivity to lovastatin, niacin, or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases; active peptic ulcer disease; arterial bleeding; pregnancy; breast-feeding

Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy
- Niacin and Derivatives Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Flushing: A common adverse effect of niacin and can be attenuated with a gradual increase in dose, and/or by taking aspirin or another NSAID (eg, ibuprofen) 30-60 minutes before dosing; avoid concurrent ingestion of ethanol or hot liquids to minimize flushing.

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid-lowering medications, including niacin at doses ≥1 g/day. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, concurrent use of potent CYP3A4 inhibitors (eg, cyclosporine, azole antifungals, macrolide antibiotics, telithromycin, protease inhibitors, and nefazodone), and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Cardiovascular disease: Use niacin with caution in patients with unstable angina or MI; risk of arrhythmias at high doses.

- Diabetes: Use niacin with caution in patients with diabetes mellitus; interferes with glucose control. Monitor glucose closely.

- Gallbladder disease: Use niacin with caution in patients with active gallbladder disease; can exacerbate.

- Gout: Use niacin with caution in patients with gout.

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease; use is contraindicated in patients with active liver disease or unexplained persistent elevations of serum transaminases. Obtain baseline transaminase levels prior to initiation of therapy; repeat in 6-12 weeks and again with any subsequent increase in dosage, then periodically once a stable dose has been reached.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use lovastatin with caution in patients taking strong CYP3A4 inhibitors (see drug interactions); consider alternative agents that avoid or lessen potential for CYP-mediated interactions.

Special populations:

- Elderly: Use with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

Advicor®: Formulations of niacin (regular release versus extended release) are not interchangeable; cases of severe hepatic toxicity, including fulminant hepatic necrosis, have occurred in patients who have substituted niacin products at equivalent doses

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

Geriatric Considerations The definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk Factor X

Pregnancy Considerations See individual agents.

Lactation Enters breast milk/contraindicated

Breast-Feeding Considerations Niacin is excreted in breast milk. The excretion of lovastatin is unknown, although similar agents are known to be excreted in breast milk. Use during breast-feeding is contraindicated.

Adverse Reactions

>10%: Cardiovascular: Flushing (71%)

1% to 10%:

Central nervous system: Headache (9%), pain (8%)

Dermatologic: Pruritus (7%), rash (5%)

Endocrine & metabolic: Hyperglycemia (4%)

Gastrointestinal: Nausea (7%), diarrhea (6%), abdominal pain (4%), dyspepsia (3%), vomiting (3%)

Neuromuscular & skeletal: Back pain (5%), weakness (5%), myalgia (3%)

Miscellaneous: Flu-like syndrome (6%)

Other uncommon adverse reactions reported with niacin and/or lovastatin include: Alkaline phosphatase increased, alopecia, anaphylaxis, angioedema, anemia, anorexia, anxiety, arthritis, atrial fibrillation, cataracts, chest pain, chills, cholestatic jaundice, cirrhosis, CPK increased (>10x normal), depression, dryness of skin/mucous membranes, dyspnea, edema, eosinophilia, erectile dysfunction, erythema multiforme, ESR increased, facial paresis, fatty liver, fever, GGT increased, gout, gynecomastia, hemolytic anemia, hepatitis, hepatic necrosis (fulminant), hepatoma, hyperbilirubinemia, hypersensitivity reaction, hyperuricemia, hypophosphatemia, hypotension, impotence, impaired extraocular muscle movement, leukopenia, libido decreased, memory loss, malaise, myopathy, nail changes, nodules, ophthalmoplegia, palpitation, pancreatitis, paresthesia, peptic ulcer, peripheral nerve palsy, peripheral neuropathy, photosensitivity, polymyalgia rheumatica, psychic disturbance, positive ANA, purpura, rhabdomyolysis, rash, renal failure, skin discoloration, Stevens-Johnson syndrome, syncope, systemic lupus erythematosus-like syndrome, tachycardia, taste alteration, thrombocytopenia, thyroid dysfunction, toxic epidermal necrolysis, transaminases increased, tremor, urticaria, vasculitis, vertigo

Metabolism/Transport EffectsLovastatin: **Substrate** of CYP3A4 (major); **Inhibits** CYP2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Niacin. *Risk D: Consider therapy modification*

Bosentan: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Danazol: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fenofibric Acid: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Niacin may enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Sildenafil: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Consumption of large amounts of ethanol may increase the risk of liver damage with HMG-CoA reductase inhibitors. Concurrent ingestion of ethanol may increase the risk of flushing associated with niacin.

Food: Lovastatin absorption may be decreased with food, however, the combination product is recommended to be taken with a low-fat snack at bedtime. Lovastatin serum concentrations may be increased if taken with grapefruit juice; avoid concurrent use. Concurrent ingestion of hot liquids may increase the risk of flushing associated with niacin.

Herb/Nutraceutical: St John's wort may decrease lovastatin levels. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

Test InteractionsNiacin: False elevations in some fluorometric determinations of urinary catecholamines; false-positive urine glucose (Benedict's reagent)

Monitoring ParametersBlood glucose, CBC, LFTs, prothrombin time (surgical patients), and serum phosphorus. Baseline CK levels, hepatic transaminase levels, and total cholesterol profile should be obtained prior to initiation of therapy. Repeat CK level with onset of unexplained muscle symptoms. Obtain repeat hepatic transaminase levels in 6-12 weeks and with any subsequent increase in dosage, then annually or more frequently if indicated once a stable dose has been reached.

Monitoring: Lab TestsBlood glucose, CBC, LFTs, prothrombin time (surgical patients), and serum phosphorus. Baseline CK levels, hepatic transaminase levels, and total cholesterol profile should be obtained prior to initiation of therapy. Repeat CK level with onset of unexplained muscle symptoms. Obtain repeat hepatic transaminase levels in 6-12 weeks and with any subsequent increase in dosage, then annually or more frequently if indicated once a stable dose has been reached.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, variable release (Advicor®):

500/20: Niacin 500 mg [extended release] and lovastatin 20 mg [immediate release] [contains polysorbate 80]

750/20: Niacin 750 mg [extended release] and lovastatin 20 mg [immediate release] [contains polysorbate 80]

1000/20: Niacin 1000 mg [extended release] and lovastatin 20 mg [immediate release] [contains polysorbate 80]

1000/40: Niacin 1000 mg [extended release] and lovastatin 40 mg [immediate release] [contains polysorbate 80]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Advicor)

500-20 mg (60): $206.70

Mechanism of ActionLovastatin acts by competitively inhibiting 3-hydroxyl-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, the enzyme that catalyzes the rate-limiting step in cholesterol biosynthesis. Niacin is a component of two coenzymes which is necessary for tissue respiration, lipid metabolism, and glycogenolysis; inhibits the synthesis of very low density lipoproteins.

Pharmacodynamics/KineticsSee individual agents.

Bioavailability: Tablet strengths (eg, two tablets of 500 mg/20 mg and one tablet of 1000 mg/40 mg) are not interchangeable; bioavailability varies.

Related Information

- Hyperlipidemia Management
- Lipid-Lowering Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause anxiety and depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with fluvoxamine or nefazodone may increase the risk of myopathy and/or rhabdomyolysis. May rarely cause leukopenia and thrombocytopenia; use caution with clozapine, carbamazepine, and valproic acid.

Cardiovascular ConsiderationsNiacin lowers LDL-cholesterol (LDL-C) and triglycerides (TGs) and increases HDL-cholesterol (HDL-C). It causes a shift from small, dense to large, buoyant LDL particles that are less atherogenic. Niacin also significantly lowers lipoprotein A levels.

Primary Prevention: HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

HMG-CoA reductase inhibitors decrease C-reactive protein (CRP), an inflammatory marker and an acute phase reactant. Elevated levels of high sensitive CRP (hsCRP), which detects CRP levels as low as 0.175 mg/L, have been shown to be associated with an increased risk of cardiovascular events. Recently, the JUPITER trial demonstrated that the use of rosuvastatin in healthy patients (men ≥50 years and women ≥60 years) without a history of cardiovascular disease with LDL <130 mg/dL and a hsCRP level ≥2 mg/L reduced the risk of major cardiovascular events (eg, nonfatal MI, stroke, death from cardiovascular causes), The number needed to treat over 5 years to prevent 1 cardiovascular event is 25. Current guidelines do not recommend drug treatment for patients with an LDL <130 mg/dL. However, identification of the patient at higher risk of cardiovascular events within this subgroup using hsCRP is now important given that statins may prevent the occurrence of these serious cardiovascular events (Ridker, 2008).

Secondary Prevention: Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

In addition to the ability of HMG-CoA reductase inhibitors to decrease levels of high-sensitivity C-reactive protein (hs-CRP), they also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other Considerations**Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Index TermsLovastatin and Niacin

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

Ezetimibe (Zetia®), Simvastatin (Zocor®), and Ezetimibe/Simvastatin (Vytorin®): Preliminary Results From the SEAS Trial - Updated September 2008

The U.S. Food and Drug Administration (FDA) has communicated important information regarding an ongoing safety review of the Simvastatin and Ezetimibe in Aortic Stenosis (SEAS) trial. The SEAS trial (Rossebo, 2008), recently available online, evaluated the effects of the combination ezetimibe/simvastatin (Vytorin®) on clinical outcomes in patients with mild-to-moderate asymptomatic aortic stenosis. The 5-year trial demonstrated that ezetimibe/simvastatin was no better than placebo in reducing the primary composite outcomes – major cardiovascular events (eg, death from cardiovascular causes, aortic-valve replacement, heart failure) or the composite outcome of aortic-valve-related clinical events and ischemia. Additionally, a higher incidence of newly diagnosed cancer of any type (105 patients taking ezetimibe/simvastatin vs 70 patients taking placebo, p=0.01) and cancer-related death (39 patients taking ezetimibe/simvastatin vs 23 patients taking placebo, p=0.05) was observed in the patients receiving ezetimibe/simvastatin compared to those receiving placebo. Of note, 8 patients diagnosed with cancer prior to randomization experienced recurrence (3 in the ezetimibe/simvastatin group vs 5 in the placebo group).

Subsequently, an interim analysis of the ongoing Study of Heart and Renal Protection (SHARP) trial and the Improved Reduction of Outcomes: Vytorin Efficacy International Trial (IMPROVE-IT) with a total of 20,617 randomized patients demonstrated no overall excess of cancer (313 active-treatment vs 326 control, p=0.61) (Peto, 2008). The SHARP trial randomized patients with chronic kidney disease to either ezetimibe/simvastatin or placebo. The IMPROVE-IT trial randomized patients with acute coronary syndrome to either ezetimibe/simvastatin or simvastatin alone. When the SEAS trial data is included in this analysis, there still is no significant excess of cancer (414 active-treatment vs 391 control, p=0.46). However, cancer-associated deaths were significantly higher when compared to controls (134 vs 92, respectively; p=0.007). Previous trials and meta-analyses involving the use of ezetimibe, simvastatin, or ezetimibe/simvastatin also have not shown an increased risk of cancer.

The FDA estimates that it will take approximately 6 months to fully evaluate the clinical trial data after receipt of the final SEAS trial report. At this time, the FDA recommends that patients continue taking their cholesterol-lowering medications.

Simvastatin and Amiodarone Concurrent Therapy: Dose-Related Increased Risk of Rhabdomyolysis - August 2008

The U.S. Food and Drug Administration (FDA) has issued an alert to remind practitioners of a dose-related increased risk of rhabdomyolysis when amiodarone is used concurrently with simvastatin at doses >20 mg. If patients require simvastatin >20 mg, an alternative HMG-CoA reductase inhibitor (statin) should be used. This information has previously been incorporated into the Lexi-Comp monograph.

Additional information may be found at http://www.fda.gov/cder/drug/InfoSheets/HCP/simvastatin_amiodaroneHCP.htm

Medication Safety Issues
International issue:

Simcor® is also a brand name for simvastatin in Indonesia.

Pronunciation(NYE a sin & sim va STAT in)

U.S. Brand NamesSimcor®

Pharmacologic Category[Antilipemic Agent, HMG-CoA Reductase Inhibitor](); [Antilipemic Agent, Miscellaneous]()

Use: Labeled IndicationsTreatment of primary hypercholesterolemia, mixed dyslipidemia (types IIa and IIb), or hypertriglyceridemia (type IV hyperlipidemia) in combination with standard cholesterol-lowering diet when simvastatin or niacin monotherapy is inadequate

Dosing: AdultsDosage forms are a fixed combination of niacin extended-release and simvastatin.

Dyslipidemia: Oral:

Lowest dose (initiate in patients naïve to niacin therapy or those currently receiving niacin immediate-release): Niacin 500 mg/simvastatin 20 mg once daily at bedtime with a low-fat snack; may increase by not more than 500 mg (niacin) at 4-week intervals

Maintenance dose: Niacin 1000 mg/simvastatin 20 mg to niacin 2000 mg/simvastatin 40 mg once daily (maximum: Niacin 2000 mg/simvastatin 40 mg once daily)

Note: If therapy is interrupted for >7 days, reinstitution of therapy should begin with the lowest dose followed by retitration as tolerated. Not for use as initial therapy of dyslipidemias. May be substituted for equivalent dose of niacin extended-release, however, manufacturer does not recommend direct substitution with immediate-release preparations.

Dosing: Renal Impairment

Mild-to-moderate impairment: No dosage adjustment required; use caution.

Severe renal impairment: Use with extreme caution or avoid unless patient already tolerating simvastatin doses ≥10 mg.

Dosing: Hepatic ImpairmentContraindicated in active liver disease or unexplained persistent elevations of serum transaminases.

Dosing: Adjustment for ToxicityDiscontinue therapy if transaminases >3 times ULN persist or are accompanied by symptoms (nausea, fever, malaise).

Administration: OralTablets must be swallowed whole; do not crush or chew. Should be taken with a low-fat snack at bedtime.

Dietary ConsiderationsContinue standard cholesterol-lowering diet during therapy. Should be taken with a low-fat snack.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to niacin, simvastatin, or any component of the formulation; active liver disease; unexplained persistent elevations of transaminases; active peptic ulcer disease; arterial bleeding; pregnancy; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- Flushing: A common adverse effect of niacin and can be attenuated with a gradual increase in dose, and/or by taking aspirin or another NSAID (eg, ibuprofen) 30-60 minutes before dosing. Avoid concurrent ingestion of ethanol, hot liquids, or spicy foods to minimize flushing.

- Hepatotoxicity: Cases of severe hepatotoxicity have occurred when immediate release (crystalline) niacin products have been substituted with sustained-release (modified release, timed-release) niacin products at equivalent doses. Initiate niacin at lower doses and titrate to achieve desired response.

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine. Discontinue treatment if CK levels rise to >10 times ULN with concomitant muscle symptoms.

Disease-related concerns:

- Cardiovascular disease: Use niacin with caution in patients with unstable angina or MI; risk of arrhythmias at high doses.

- Diabetes: Use niacin with caution in patients with diabetes mellitus; niacin may increase fasting blood glucose, although clinical data suggest increases are generally modest (<5%). Monitor glucose; adjustment of hypoglycemic therapy may be necessary.

- Gallbladder disease: Use niacin with caution in patients with active gallbladder disease; use can exacerbate.

- Gout: Use niacin with caution in patients with gout; may increase uric acid levels.

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease; use is contraindicated in patients with active liver disease or unexplained persistent elevations of serum transaminases. Transaminases should be monitored during therapy; if levels elevated, repeat test (confirmatory) and monitor frequently until transaminases return to normal; therapy should be discontinued if transaminase levels >3 times ULN persist or are accompanied by symptoms (nausea, fever, malaise).

- Renal impairment: Use with caution in renal impairment; use with extreme caution or avoid in severe impairment unless patient already tolerating simvastatin doses ≥10 mg.

Concurrent drug therapy issues:

- High potential for interactions: Use simvastatin with caution in patients taking strong CYP3A4 inhibitors (see Drug Interactions); consider alternative agents that avoid or lessen potential for CYP-mediated interactions.

Special populations:

- Elderly: Use with caution in elderly patients; these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Product interchangeability: Bioavailability of niacin formulations vary (regular release versus extended release) and are not interchangeable; cases of severe hepatic toxicity, including fulminant hepatic necrosis, have occurred in patients who have substituted niacin products at equivalent doses. In addition, bioequivalence between different Simcor® dosage strengths has not been evaluated and strengths should not be considered exchangeable.

Other warnings/precautions:

- Appropriate use: Prior to initiation, secondary causes for hypercholesterolemia (eg, poorly controlled diabetes mellitus, hypothyroidism) should be excluded.

Pregnancy Risk FactorX
Pregnancy ConsiderationsSee individual agents.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsNiacin is excreted in breast milk. The excretion of simvastatin is unknown, although similar agents are known to be excreted in breast milk. Use during breast-feeding is contraindicated.
Adverse ReactionsReactions/percentages reported with combination product; also refer to individual agents.

>10%: Cardiovascular: Flushing (up to 59%)

1% to 10%:

Central nervous system: Headache (5%)

Dermatologic: Pruritus (3%)

Gastrointestinal: Diarrhea (3%), nausea (3%)

Neuromuscular & skeletal: Back pain (3%)

Frequency not defined: Alkaline phosphatase increased, amylase increased, bilirubin increased, creatinine kinase increased, fasting blood glucose increased, GGT increased, LDH increased, phosphorus decreased, platelets decreased, prothrombin time increased, thyroid function test abnormalities, transaminases increased, uric acid increased

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2C8 (weak), 2C9 (weak), 2D6 (weak)
Drug Interactions

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Niacin. *Risk D: Consider therapy modification*

Bosentan: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Danazol: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fenofibric Acid: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Niacin may enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Imatinib: May decrease the metabolism of Simvastatin. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Ranolazine: May increase the serum concentration of Simvastatin. *Risk C: Monitor therapy*
